for the Rubber Industry

Antioxidants

Flectol* H (Condensation product of acetone and aniline)

Santoflex* B (Reaction product of acetone and para-aminobiphenyl)

Santoflex BX (Constant composition blend of Santoflex B and N,N'-Diphenyl-para-phenylenediamine)

Santoflex 35 (Same composition as Santoflex BX but with higher N,N'-Diphenyl-para-phenylenediamine content)

Santowhite MK (An alkylated phenol sulfide) (Liquid)

Santowhite Crystals (An alkylated phenol sulfide) (Crystalline powder)

Thiazole Accelerators

Santocure* (N-Cyclohexyl-2-benzothiazole-sulfenamide)

El-Sixty* (Di-benzothiazyl-dimethylthiol-urea)

Mertax (2-Mercaptobenzothiazole) (purified)

Ureka* Base (2,4-dinitrophenyl thiobenzothiazole)

Ureka C (Benzothiazyl thiobenzoate)

Thiotax (2-Mercaptobenzothiazole)

Thiolide* (Benzothiazyl disulfide)

Aldehyde Amine Accelerators

A-32 (Reaction product of butyraldehyde and butylidene aniline)

A-77* (Condensation product of acetaldehyde and aniline)

A-100 (Aldehyde derivative of a Schiff's base made with use of both butyraldehyde and acetaldehyde)

Guanidine Accelerators

DPG (Diphenylguanidine)

Guantel* (Reaction product of diphenylguanidine and phthalic acid)

Ultra Accelerators for Latex, Etc.

B-2 Crystals (Reaction product of carbon bisulfide with methylene dipiperidine)

Pip Pip (Piperidine N-Pentamethylene-dithiocarbamate)

Ethyl Thiurad* (Tetraethyl-thiuram-disulfide)

Mono Thiurad (Tetramethyl-thiuram-monosulfide)

Thiurad (Tetramethyl-thiuram-disulfide)

Methasan* (Zinc salt of dimethyl dithiocarbamic acid)

Ethasan* (Zinc salt of diethyl dithiocarbamic acid)

Butasan* (Zinc salt of dibutyl dithiocarbamic acid)

Special Materials

A-1 (Thiocarbanilidine) **Insoluble Sulfur 60**

Retarder ASA

Santovar* A (An alkylated polyhydroxy phenol)

Santovar O (An alkylated polyhydroxy phenol)

BATES, TANNING

Hides and skins are bated first, to remove the free and combined lime, and second, to reduce the swelling of the collagen fibres, caused by the lime, thereby restoring the hides and skins to the required degree of softness or flaccidity. Before the introduction of modern synthetic bates, the most commonly used materials were hen, pigeon, and dog dungs. When hen or pigeon dung was used, the process was called bating, and when dog dung was used it was called puering. Value of dung for defliming and falling purposes was caused by its ammonium chloride content and presence of certain enzymes. Artificial bates are usually compounded with a suitable ammonium salt, pancreatic enzymes, and an inert filler.

BOIL-OFF COMPOUNDS, RAYON

Strictly there is no "boiling-off" of rayon, since no sericin or gum is present; however, some rayon is not delivered by the manufacturer to the dyer in the bleached state, and does contain oils used in twisting, winding, sizing, etc., and fats, etc., employed in manufacture, so that the yarn must be scoured thoroughly. See Boil-Off Compounds, Textile; Detergents, Textile.

BUFFING COMPOUNDS

Compounds applied to the buffs (disks of cloth or similar pliant materials) used in the buffing operation which follows the polishing operation on metals. Buffing usually is classified in two ways "cutting down" and "coloring." For the first, specially processed tripoli or emery and tallow are commonly employed, and for "coloring" aluminum oxide or chromium oxide compounds are popular. Other preparations are specially compounded with tripoli and chromium oxide, with pumice, emery and a machine oil, with soap-bark powder and water, with pumice and a grease-removing solvent, others contain lime.

CABLE FILLING COMPOUNDS

Plastic compounds for filling joints in rubber, varnished cambric, or paper insulated cables so as to prevent entrance of moisture and to give suitable electric properties. Should be acid and alkali-resistant, possess high waterproofing qualities, excellent adhesive properties, bonding perfectly to metals, porcelain, and glass. Should be extremely flexible and should withstand abrupt temperature changes.

CASE-HARDENING MATERIALS

Compounds which impart surface hardness to steel through the absorption of carbon during a heating followed by a quenching operation. The basis of case-hardening or carburizing compounds is usually wood charcoal, together with certain so-called "energizers" such as sodium or barium carbonates, cyanides, etc. Many compounds also have oil or other organic binders.

CEMENTS, BRISTLE SETTING

Cements, usually formulated with synthetic resins or rubber, used for setting bristles in brushes to provide a tenacious bond. They should have great durability and excellent resistance to benzene, oils, water and most paint and lacquer thinners. The viscosity of the bristle setting cement should be worked out experimentally in the brushmakers' plant.

CEMENTS, RUBBER

Because of rubber's wide variability in tackiness it is well adapted for use in cements when formulated with proper solvents. Rubber cements are largely used: 1. As binders to hold materials in position until sewing or clamping is accomplished; 2. As permanent bonds; 3. As vulcanized seals. Rubber cements are used in shoe-manufacturing, by automotive manufacturers for assembling upholstery, as sound deadeners, in the manufacture of pocket-books, impregnation of paper and wood fiber, for repairing tires and tubes, in balloon cements, in fastening linings to insides of tankcars, in securing rubber insulators to metal supports, etc. Latex cements are employed in fabricating carpets, for making mohair fabrics, for fastening the long hairs in haircloth used in lapels of coats, for the rubber setting of brushes; and for binding purposes in brake-lining compounds.

CLEANERS, BOILER-TUBE

Chemicals or compounds used to remove scale and rust in boiler tubes and to prevent further formation by neutralizing the soluble salts in the feed-water (largely carbonates of calcium and magnesium), precipitating them out of solution usually in the form of a colloidal sludge, which may be expelled from the boiler when it is "blown down." Various combinations of products are used to meet specific conditions, but the most ingredients include sodium silicate, trisodium phosphate, tannins, soda ash, sodium chromate, sodium alginate, starch, glucose, graphite, kerosene, barium compounds, etc. See also Boiler Compounds.

metso cleaners for industry

Metasilicate ($Na_2SiO_3 \cdot 5H_2O$)
Sesquisilicate ($Na_3HSiO_4 \cdot 5H_2O$)

Vigorous alkaline power is balanced with the right soluble silica content which accelerates cleaning action. This combination also prevents re-deposition of removed soil and protects sensitive metals.

For private compounds and cleaners — add these detergent qualities plus attractive appearance, uniform dependability. Easy to work into your formulas.

PHILADELPHIA QUARTZ COMPANY
1168 Ledger Building, Phila. 6, Pa.

CLEANERS, METAL

Special detergents for metal surfaces, removing dirt, grime, grease, oil, etc., previous to finishing, electroplating, etc., also products used for cleaning after such operations. Many of the more common detergents are used; in recent years special advances have been made, new products, new technique developed such as electrolytic cleaning in soap baths, electrolytic acid cleaning, vapor degreasing, use of solvent soaps, orthosilicates, metaphosphates, various new silicates, alkylated naphthalene sulfonic acids, sulfonated fatty alcohols (so-called wetting agents), naphthenic acids, etc.

COLOR LAKES, COSMETIC

Consists generally of suitable aniline colors precipitated on aluminum hydroxide, blanc fixe or other harmless substrata. These color lakes must naturally be extraordinarily free from such heavy metals as lead, arsenic, mercury, etc. Their tinctorial power is high. In lipstick and rouge they are employed almost exclusively. In face powder for toning—, largely in eyeshadows—somewhat in creams—but not often in liquids and lotions due to their tendency to bleed (run).

COLORS, BUTTER AND CHEESE

Natural and synthetic dyestuffs used to tint butter, oleomargarine and cheese. Use of certified colors only is permitted in food products to enhance their appearance and make them more pleasing to the eye, but they are forbidden to hide inferiority or deceive the purchaser. Users should be fully familiar with Federal Food and Drug Act and state and local regulations. In almost every case where artificial color is used, it must be declared on the label—the suggested legends being: "Artificially Colored." "Artificially Colored with Certified Color," "Artificially Colored with Vegetable Color," or some such similar phraseology. See Colors, Food.

COLORS, GLASS

Liquids often containing resinates or similar organic compounds of various metals, the oxides of which form colors or pigments used for decorating pottery glass, tile, terra-cotta or similar ceramic surfaces. Another type of colors is that which consists of finely ground mixtures of pigments and low-melting glasses. This type is usually "fired" so that the color is directly incorporated into the finished article and is not simply a finish coat.

COLORS, INK

Dyes and pigments employed as the tinting agent. A limited number of water soluble dyes are used to make writing inks which contain water as the liquid medium. Other dyes, soluble in glycerine, are used in stamping, copying, and hectograph inks. Still others, soluble in such organic solvents as alcohols, ketones, hydrocarbons, esters, acids, and aldehydes, are used to make aniline and intaglio printing inks. Very definite limitations are imposed on the choice of ink colors, such as pigment particle size, brilliancy, intensity, resistance to light, oil absorption, tinting strength, bleeding, resistance, to the chemical action of the products they may come in intimate contact with, such as adhesive pastes, vinegar, wet soaps, waxed wrappers, alcohol, lard, ammonia, etc. Colors must be carefully chosen for each type and use of ink made. See also Colors, Printing Ink.

COLORS, INK PRINTING

Dyes and pigments employed in ink manufacture are of various types:—1. Dyes of satisfactory light resistance and minimum bleeding tendencies that can be used without conversion to lakes; often termed dye-pigments, of which toluidine red is an example; 2. Basic dyes "laked" by suitable acids; an example of which is the combination of methyl violet with phosphotungstic acid; 3. Dyes containing sulfonic acid groups which combine with basic substances (metallic compounds) for form pigments—these are acid dyes "laked" by suitable metals, an example of which is the combination of lithol red with barium chloride to form the red pigment, barium lake. Taree classes of inorganic pigments are recognized based on color and opacity:—1. Substances derived from lead, iron, chromium, sulfur, cobalt, cadmium, and other chemical elements including carbon. These are competitive in inks with the organic pigments and at times are mixed with them in the same ink. An example of an inorganic pigment is chrome yellow; 2. Colorless, transparent substances derived from aluminum, magnesium and calcium which behave in inks like the colored pigments except that they have no color and act only as fillers and add opacity to the ink; known as opaque whites. Good ink pigments are of small particle size so that the pigment can readily be carried by the ink vehicle from the ink fountain to the paper. Good halftone printing requires even smaller particle size of the pigment to prevent filling of the screens.

COLORS, LACQUER

Colors of low oil absorption, chemically inert (mainly pigments) possessing good permanency, soft texture, great tinctorial strength and good hiding power. The colors are ground by various means in some ingredient of a lacquer and the paste so formed is then mixed into the remaining ingredients of the lacquer to produce a finished colored lacquer.

COLORS, RUBBER

Mineral pigments or synthetic dyes (usually in the form of lakes, bound to a mineral base) not greatly affected by heat, steam, or sulfur: for white shades zinc oxide and the titanium pigments are largely used; for black, carbon black, lampblack, or one of the charcoal blacks; for blue, ultramarine is often used; chrome pigments, for green; zinc chromate is standard yellow pigment; cadmium sulfides are available in various yellow and orange shades; golden antimony, for orange shades, or ochres where color value at low cost is the deciding factor; for crimson shades iron oxide red, crimson antimony, and vermilions are extensively used. DESIZING AGENTS

Sizes of the gelatine, glue, gum, oil, wax, paraffin, or starch variety, must be removed from fabrics before dyeing. Certain of these can be emulsified and removed by washing with a suitable detergent. Starch must be converted into a water-soluble compound and this is done with enzymatic products, which digest the starch, converting it into maltose. Other desizing agents are of the solvent type. See also Enzymatic Preparations.

SYNTHETIC DETERGENTS

KREELON 4D . . . *40% synthetic detergent flake*

KREELON 4G . . . *40% synthetic detergent powder*

KREELON 7D . . . *70% synthetic detergent flake*

Kreelon* is an efficient synthetic detergent and wetting agent. It *penetrates, spreads, emulsifies, disperses and cleans as it wets.* Its great value lies in its ability to function well in acid, alkaline or neutral solutions, and in hard or soft waters—either alone or in solutions and dry mixes with a great number of other chemicals.

DETERGENTS, TEXTILE

Specially formulated compounds prepared for cleansing textiles. Each type of textile fibre presents its own special problem. Textiles are washed at various stage of manufacture. In recent years advances have been made in studying the peculiar requirements at each stage and in the accurate control of pH values, etc. Scientifically prepared products help to preserve tensile strength, provide better resistance to abrasive action, give whiter colors, assist in penetration of dyes, more level shades, etc.

DISCHARGE AGENTS, TEXTILE

Usually a reducing agent most common of which is sodium hydrosulfite. Used to reduce the ground color in discharge printing on silk, cotton or rayon fabrics, as an ingredient in vat dyeing and as a stripper to remove dyestuffs from fabrics for redyeing. There are several proprietary products for special stripping purposes where hydrosulfite is ineffectual or unsuitable.

DISINFECTANTS, COAL TAR

Coal tar disinfectants owe their potency largely to the phenolic compounds they contain and are made in emulsion and soluble types. The emulsion type is made from tar acid oils, soaps (frequently rosin soap) and water, and when diluted for use in water form whitish emulsions. They are manufactured with phenol coefficients ranging from 2 to 20. The soluble type is made from tar acids, usually cresols and xylenols, soap, alkali and water and form clear or slightly opalescent solutions when diluted with water for use. Liquor cresolis compositus U.S.P. XI is a soluble type disinfectant made according to the specifications of the U. S. Pharmacopoeia. The Bureau of Animal Industry (B.A.I.) type is another example of the soluble type coal tar disinfectant.

DYES, COTTON

Dyes for cotton include the direct or substantive dyes which are water soluble products that dye cotton directly without the use of a mordant; the basic dyes which are water soluble dyes but which require that the cotton be first mordanted, usually with tannic acid and antimony salts; the sulfur dyes, insoluble in water but soluble in sodium sulfide, from which solution they dye cotton directly; the vat dyes, insoluble in water but soluble in caustic soda and sodium hydrosulfite. The vat dye solution possesses a direct affinity for the cotton and, by subsequent oxidation, reproduces the original insoluble form of the dyestuff. In general the vat dyes possess the best fastness to washing and light; the direct dyes in general are of moderate to fair fastness to washing and from moderate to very good fastness to light; the basic dyes are poor in light fastness but are extremely bright; more so than any other class of cotton dyes; the sulfur dyes may be considered as being faster than the direct dyes but not as fast as the vats. Many of the direct dyes can be after-treated with metallic salts or with formaldehyde with a consequent increase in fastness either to light or to washing. Another group of direct dyes, commonly called development dyes, are applied in a similar manner to the usual direct dyes but, by subsequent diazotization and development, yield shades rather faster to washing. Another group of dyes for cotton is the Naphthol dyes, generally of good fastness to light and washing. These dyes are formed directly on the fibre itself.

DYES, HAT

Hats are dyed with wool dyes. For solid shades the hat bodies are dyed with acid dyes especially selected for their ability to penetrate the dense body of the hat and to dye extremely level. It is also essential that the dyes possess marked fastness to light. For mottled shades the material is dyed before the body is formed, in which case chrome dyes are used.

DYES, HOSIERY

Dyes for hosiery are selected according to the nature of the material being dyed. Pure silk hose requires acid dyes of good washing fastness, and are supplemened by substantive cotton dyes when the fabric contains cotton toe and heel re-inforcements. Direct dyes are used for cotton and rayon hose: sulfur dyes for all cotton hose, particularly black: acid and chrome dyes for wool.

DYES, LACQUER

Dyes soluble in lacquers. By incorporating them, various colored but transparent lacquers are produced. Their use over metal, paper, etc., gives pleasing effects as the transparent lacquer allows the finish of the base material to show through. For Suppliers see Dyes, Resin.

DYES, LEATHER

Basic, acid, direct, chrome and developed dyes are used on leather. Basic dyes are used on all types of leather and require a vegetable tannage as a mordant; they are also used for topping acid, direct, chrome and developed dyes, where strength and brightness are required. Acid dyes are used on all classes of leathers and tannages where level dyeing is required. The exceptionally soluble acid dyes are used where penetration is desired, as on suedes which are buffed after dyeing. Acid dyes also are used in finishes for grain leathers and edge inks. Direct dyes are surface dyeing dyes and are used principally on chrome leathers, also in combination with acid dyes and chrome dyes. Chrome dyes are used in the same manner as acid dyes on both chrome and vegetable tanned leathers. Developed dyes are used on chrome tanned leathr where very good fastness to washing is required.

DYES, MIXED FIBRES, COTTON AND RAYON

Cotton dyes, usually the direct or substantive type, are used for dyeing cotton and rayon fabrics. Since both of these fibres consist of cellulose and differ in their affinity for dyestuff, considerable care must be taken to select dyes and to conduct the dyeing operation so that a shade as uniform as possible will be obtained on both fibres.

DYES, PAPER

Specialized dyes added to the pulp and fixed either by direct absorption or by precipitation. There are three general classifications:—1 Basic dyestuffs (precipitated in combination with acids); 2 Acid dyes (precipitated in combination with certain bases); and 3, the so-called "cotton" dyes which are readily absorbed by the cellulose fibres. Natural Dyestuffs, such as Logwood, Sap Brown, etc., are also used. See also Pigments, Paper: Pigments, Blue, Red, Yellow, Brown; Mineral, Chemical, etc.

DYES, RAYON

Rayon is dyed using the same dyes as cotton. The direct dyes are used where simplicity of application is desired or where fastness requirements are not severe. Sulfur and, more particularly, vat dyes are used whenever the best fastness is desired.

DYES, RESIN

Molded plastics are colored with dyes from the various groups, especially selected to withstand the heat and the various chemicals used to disperse or dissolve readily during molding and to possess the necessary fastness properties. Cast resins are dyed with dyes especially selected from the various dye groups in regard to solubility in the resin and ability to withstand the reducing action in the kettle.

DYES, SILK

Silk (as for instance silk hosiery and silk dress goods) is usually dyed with acid or direct dyes. For silk dress goods it often is desirable that the dyes be readily discharged with hydrosulfite in order to produce various patterns.

DYES, SPECK

Speck dyes consist of direct dyes which possess a marked affinity for cotton and other forms of vegetable matter and little if any for wool. They are principally used to cover up specks of cotton, etc., in woolen fabrics without changing the shade of the wool.

DYES, UNION GOODS (Cotton and Wool)

Practically all material of this sort is dyed with direct and acid dyes. The acid dyes are selected for their ability to dye the wool in a neutral bath. The fastness varies according to the dyes selected and the shade desired. For suppliers see Dyes, Acid; Dyes, Direct.

DYES, WOOL

Wool ordinarily is dyed with acid dyes or chrome dyes. The acid dyes are used in piece dyeing ladies' dress goods where brightness of shade, level dyeing, moderate-to-good light fastness are the principal requirements. They are easily and quickly applied. Where particularly good fastness to washing, fulling and light are desired the chrome dyes are used. These are more expensive to apply as they require a longer time than the acid dyes.

DYNAMITE

A general term covering a large number of specific products, but essentially it is a combination of a high explosive, such as nitroglycerin, with certain oxidizing salts and suitable absorbents. For certain uses nitro-cotton may be added to dynamite. Dependent upon the amount added, a more or less gelatinous product is made which is classed as "gelatin dynamite." See explosives.

ELECTROPLATING SOLUTIONS

Solutions for the electro-deposition of metals. In addition to water the solutions contain a compound usually a salt of the metal to be deposited, and in most cases one or more substances which are added to improve the conductivity of the solution or to influence the character of deposit. These solutions properly formulated and with proper equipment give us the high type of rust protected and decorative metal finishes today.

TRUE WYOMING BENTONITE

(Colloidal Clay)

Bentonite's unusual colloidal properties make it an excellent suspending and emulsifying agent for asphalts - oils - pharmaceuticals - clays and many other materials. Small amounts of our Bentonite produce high swell or gel for desired emulsions. Write for information, prices and samples. For nearest sales office see our advertisement under Bentonite.

ENAMELS, ACID-RESISTING (Enamels Defined)

Official A.S.T.M. definition "A special kind of paint which flows out to a smooth coat when applied and dries to a smooth, glossy, relatively hard, permanent solid when exposed in a thin film to the air. An enamel always contains a pigment and has considerable hiding power and color. Some enamels dry to a flat or eggshell finish instead of a gloss finish." Specially prepared enamels because of certain ingredients exhibit the characteristic of being very acid resistant.

EXTRUDING COMPOUNDS

Synthetic resin plastics which are not compressed or hardened in a closed mold, but which are treated in a mold open at the inlet and outlet sides. With increasing pressure the mass passes from the solid to the plastic state, and is then gradually hardened, all the time being in periodical or continual motion. On the discharge side of the extruding machine special devices are used to form the material as it emerges into various shapes. For suppliers see Molding Powders-Plastic.

FAT LIQUORS

Process of "fat-liquoring" comprises three distinct operations: coloring, filling, and oiling, but often all are done to one step. Fat-liquoring proper consists of filling leather with soaps, oils, starch, china clay, tallow, egg yolk, and a number of other materials to strengthen the fibres and render the leather soft and pliable, at the same time giving it the desired color. Process is usually carried out at a high temperature in the drum tumbler and changes the leather to black or colors. Prepared fat-liquors are scientifically compounded products containing a wide variety of substances, depending upon the producer and the type of leather to be processed.

FILLERS, WOOD

Pastes or liquids specially for sealing wood surface to make it smooth and fill the cellular spaces so that the succeeding finishing coats will not penetrate but will provide a surface finish. Pastes are often used for all open-grained woods, such as oak, ash, chestnut, while liquids are preferred for close-grained woods, such as pine, fir, gumwood, and cypress. Fillers should also aid as a bond between the wood and the finishing coats.

FILTER AIDS — Celite — MINERAL FILLERS

CELITE FILTER AIDS are produced by Johns-Manville in many types of varying degrees of fineness to provide maximum flow rates with required clarity in the filtering of scores of products, from sugar and syrups to drugs and lubricants.

CELITE MINERAL FILLERS have been developed in varying grades for many industrial processes where specific properties are required. They provide high absorption, light weight, large surface area, low refractive index and superior suspension.

FIREPOOFING COMPOUNDS, WOOD

Chemicals or specially prepared combinations of chemicals which when applied to wood will not actively support combustion, thus preventing the wood from bursting into flame, but charring instead. In most cases the chemicals used to impregnate the wood when heated emit a smothering gas or composition of gases which will keep oxygen from air from supporting combustion.

FLUXES, WELDING

Welding fluxes in the form of powder are used in welding certain metals. In general, the purposes of fluxes are as follows:—1. To float all impurities to the surface of the molten metal; 2. To cleanse the weld by chemical action; 3. To protect the molten metal against oxidation by contact with the air, and to dissolve any oxide that may have existed in the metal at the weld; 4. To aid fusion, between the molten metal from the filler rod and the metal being welded. In the welding of steel castings, plates and wrought iron, no flux is required ordinarily, but the use of the proper flux when welding with cast iron, bronze, brass, copper and aluminum is essential only from the standpoint of weld quality, but is economical in speeding up the rate of welding.

FLY SPRAY BASES (Petroleum)

Carefully refined kerosene, comparatively colorless, odorless, and tasteless, used by producers of fly sprays, cattle sprays, horticultural sprays, etc., and to which is added an active ingredient and perfume material. Usual minimum B.P. 325°F.-maximum, 510°F. The relative proportions of light and heavy high boiling, slow evaporating fractions vary according to each manufacturer's refining practices and the specifications presented by users. Cont.—drums; tanks.

GAS ODORANTS (For Natural and Manufactured Gases)

Preparations which are added to natural gas, carburetted propane or butane, mixed manufactured and natural gases, etc., to give by their characteristic odor a warning to people of leaking gases and to permit repair crews to detect losses from leaks in mains, etc. A warning odor should suggest gas and should be sufficiently strong and distinctive to definitely attract attention to its source.

GASOLINE ANTI-KNOCK COMPOUNDS

Products added to gasoline to correct the tendency of a fuel to "knock" or detonate. The phenomenon known as knock, or detonation, is caused by an abnormally rapid pressure rise or explosion within the engine cylinder. This violent combustion delivers a hammer-like blow to the piston head and combustion chamber walls. Aside from the disagreeable sound produced when a fuel is knocking, a serious loss in engine power results. The anti-knock characteristics of a fuel can be improved by either adding another fuel of higher quality (alcohol, toluol, benzol, etc.), or by the addition of a knock suppressor.

GREASES, CABLE

Special greases, usually containing graphite as one of the constituents, used for the lubrication of wire ropes, chains, exposed gears, cranes, derricks, dredges, steam shovels, pile drivers, pump plungers, hoisting engines, quarry machinery, mining machinery, elevator plunges, elevator guides, fire hydrant valves, etc., where maximum degree of protection against the action of water is equally important as the question of lubrication.

GREASES, CUP

Usually lime or soda soap greases, made in a wide range of consistency, according to the relative percentages of mineral oil and soap in them and the viscosity of the mineral oil employed. Should be free from fillers, but may contain graphite. Usually produced by mixing mineral oil with a calcium soap to give a desired "body" or "consistency." Most cup greases contain from 1 to 3% water.

GREASES, FIBRE

Soft, fibrous greases having a very high melting point. Like engine greases they are "soda soap" greases. The peculiar fibrous or spongy texture is caused by the way the batch is handled in the kettle. They are, however, boiled greases and contain only a faint trace of water. They have a low coefficient of friction, and because of their nature they form a very strong lubricating film. They are not generally suitable for under-water lubrication as the soda soaps are soluble and will dissolve.

HUMECTIFIERS

Some materials, such as textiles, regenerated cellulose, tobacco, leather, glue, etc., must remain flexible and slightly moist to retain their usefulness, and conditioning or humectant agents are used to maintain these conditions of moisture indefinitely. A "humectant" is described as a hygroscopic material suitable for incorporation with many materials of everyday use to attract water to keep them slightly moist and flexible. Each humectant has a different "humectant" range, meaning the degree of change or range in moisture content in the face of changing relative humidity conditions.

MOISTURE STABILIZER

Sorbitol gives products "moisture stability"—ability to resist undesirable effects of humidity changes. . . longer retention of original "condition."

Non-volatility, high viscosity, and chemical stability give sorbitol superior plasticizing and conditioning action.

INHIBITORS, CORROSION

Variety of products used principally in the art of pickling iron and steel in various forms; to remove scale. Addition agents in acid solutions to control or prevent solution of metals. Some advantages of use of inhibitors are:—economy of acid and steel; reduction in the embrittlement effects of diffused hydrogen in the steel itself; in certain cases a large reduction in the fume or spray from the pickling tanks; reduction in maintenance costs.

HIBITITE

High-powered pickling inhibitor

General Information: HIBITITE: Reddish brown powder soluble in both concentrated sulfuric and muriatic acids.

1. Protects the metal by causing the acid to work on the scale and not on the metal.
2. Saves acid by making the acid work on the scale only.
3. Saves metal by preventing the acid from attacking it.
4. Promotes the production of clean, bright, high-quality steel.
5. Reduces acid spray and the corrosion and dangers caused by acid spray.
6. Reduces the possibility of embrittlement caused by hydrogen penetration.

INKS, PRINTING AND LITHOGRAPHING

The variety of surfaces upon which inks are printed—various types of paper, tin, cloth, Cellophane, Celluloid, etc., makes a wide variety of types necessary among which the more common are: 1. Newsprint inks which dry by absorption: 2. Book inks which dry by

INKS, PRINTING AND LITHOGRAPHING (cont'd)

oxidation for use on aised papers; 3. Lithographic inks, which consist chiefly of bodied linseed oil and pigment or dye. Newsprint inks usually consist of rosin dissolved in a cheap mineral oil, such as spindle oil or paraffin oil. This varnish is then used as a grinding liquid for the carbon black pigment. The rosin is generally dissolved in the oils by the aid of heat. Petroleum and petroleum pitches are sometimes used to reduce tack. Book inks usually contain rosin and other varnish gums, but very high grade inks of this type usually consist only of bodied linseed oil and special driers.

INSECTICIDE BASES

An insecticide is defined in the Insecticide Act of 1910 as "any substance or mixture of substances intended to be used for preventing, destroying, repelling or mitigating any insects which may infest vegetation, man or other animals or households or be present in any environment whatsoever." A few materials, such as sulfur dust, have both insecticidal and fungicidal value. Among the more common insecticides and fungicides are the arsenicals (Lead Arsenate, Calcium Arsenate, Paris Green, White Arsenic, Sodium Arsenite Solution); sulfur compounds (Calcium Monosulfide, Lime Sulfur, Sulfur Dust); oils and organic compounds (Kerosene, Creosote Oil, Mineral Oil Emulsions, Petroleum Oil, Naphthalene, Paradichlorbenzene); Pyrethrum, Nicotine Sulfate, Derris, Cube. More important fungicides are Copper Sulfate, Zinc Chloride, Sodium Fluoride. Other products employed in the insecticide and fungicide fields include: Zinc Arsenite, Magnesium Arsenite, Magnesium Arsenate, Arsenical Cattle Dip, Copper Carbonate, Cryolite, Ethyl Mercuric Chloride, Pine-Tar Oil, Coal Tar Distillates, Acid Hydrocyanic, Carbon Disulfide, Ethylene Dichloride, Ethylene, Oxide, Calcium Cyanide, Sulfur Dioxide, Fluosilicates, etc.

INSULATION MATERIALS

Products whose physical properties are such that they possess specially low thermal conductivity. No one or two types of material will serve under the wide variety of conditions insulation is called upon to meet. The temperature may be far below zero, or above 3000°F. The surface to be insulated may be a pipe, a tank, or a furnace floor, wall, roof, or door. It may be regular in contour, or broken up with projecting fittings or accessories. The insulation may be indoors or outdoors, may be subjected to abuse, or to severe vibration or mechanical abrasion. Four mineral products—asbestos, magnesium carbonate, diatomaceous earth and rock or mineral wool and also waste products of vegetable origin are among the principal raw materials out of which insulation materials are produced. Insulation is commonly supplied in the form of sectional pipe covering; insulating sheets, blocks, bricks, and blankets; insulating cements, fillers, and finishes; insulating papers and felts; as well as lightweight aggregate used with Portland cement for making insulating concrete. Materials are available for use throughout the entire range of temperatures used in industrial processes, from the extreme sub-zero temperatures used in the treatment of oils, chemicals, etc., to extremely high temperatures employed in metallurgy, etc. See also Fillers, Insulating.

SANTOCEL

for thermal insulation

Properties: Santocel is silica aerogel, the most efficient insulating material available. Apparent density less than 5 lbs. per cu. ft. K factor, 0.1 at —100° F. mean temperature.

Typical Analysis: SiO_2, 94%; sodium sulfate, 3%; Fe_2O_3 and Al_2O_3, 1.0%; volatile, 2.0%.

JAPANS

Black coatings employed on metal and hardened usually by heat. Bituminous materials are the chief constituents of Japan finishes, together with resins, paint oils, and solvents, such as toluol and solvent naphtha. Finishes of this type are usually applied by dipping metal articles into the Japan and then baking at temperatures of approximately 300° F.

LACQUER BASES

In formulating lacquers, certain stock or base lacquers serve as the starting point from which special lacquers are produced. For example, a 25% solution of nitrocellulose may be termed a base solution. As is, it is of no value as a lacquer but when color, resins, etc., are added colored lacquers for various uses are produced.

LACQUERS, BRUSHING

Lacquers formulated to be applied with a brush: must "flow" so smoothly and evenly that the brush marks are not discernible when dry, also care that second coats will not "lift" the first through action of the solvents employed. These objectives are achieved, first, by using a great excess (usually three to one) of gum over cotton; second, solvents and diluents are so adjusted that the gum is not readily soluble in the mixture with the idea that the dry film will be resistant to the brush abrasion when additional coats are applied; third, the lacquer is formulated with as much pigment as possible; fourth, the solvents and diluents are carefully chosen so that the mixture is non-blushing.

LACQUERS, CLEAR

A lacquer which has no colored pigment or dye incorporated in it is termed a clear (transparent) lacquer. The dry film of lacquer, therefore, is transparent allowing the surface underneath to show through. A typical example is a clear metal lacquer.

LACQUERS, EMULSIFIED

Lacquer emulsions consist of extremely viscous, dough-like lacquer base dispersed in a relatively small percentage of water; plus a very high solids content (film forming) and it also permits the use of nitrocellulose of much higher viscosity. Find special application in coating porous materials, also in coating paper.

LACQUERS, HEAT RESISTING

Lacquers especially formulated to resist heat usually do not contain nitrocellulose. Often they are made with certain types of synthetic resins which withstand temperatures up to 600° F. They are used on parts of stoves, heaters, and similar articles. One special type is used on ash trays and withstands the heat of lighted cigarettes and cigars.

LACQUERS, LEATHER

These are lacquers applied to leather to produce color effects or to emphasize and preserve the original beauty of the leather. These lacquers must be flexible and soft as the leather to which they are applied must not lose its "feel."

LACQUERS, METAL

Clear lacquers are used to prevent tarnishing, and to give a protective and decorative coat over metals. Pigmented lacquers of relatively low solid content are employed for coating metal surfaces since the metal surface is generally smooth and a thin film is therefore entirely satisfactory. The question of proper adherence is important in lacquers for metal. See also Lacquers, Clear.

LACQUERS, RUBBER

Specialized products in which necessary modifications of flexibility and adhesion are considered in the formulation, particularly in the choice of plasticizer for the lacquer, the method of cure of the rubber, the accelerators and anti-oxidants employed, etc. Generally there are two types of lacquer finishes for rubber; the continuous or after vulcanization; the discontinuous film lacquers, confined to pigmented lacquers and designed to be used where an exceedingly dry film variety, which includes all clear lacquers, applied either before surface is preferable. Lacquers of this latter type are usually applied before vulcanization and provide a film which is cracked so finely that the cracks can hardly be noticed. Such lacquers must withstand the heat of vulcanization without breaking down.

LARVA KILLING COMPOUNDS

Preparations employed largely for killing the larvae of mosquitoes. Usually of the coal-tar emulsifiable oil-type. Should not be affected by either rain or wind-fall; should mix completely with the stagnant water, penetrating to the bottom to destroy larvae (wigglers). Should be non-poisonous to live stock. Special types are available which will readily mix with salt, or brackish, water.

Synthetic resins of various chemical composition, thermo-setting by nature, which set permanently under heat and pressure in hardened steel molds to form various three-dimensional shapes. Supplied in black and also in wide variety of colors. Used in making thermometers, barometers, office-equipment cases, stove fittings, utensil handles, clock and radio cases, telephones, microphones, cameras, scales, trays, lamp-bases, display stands, containers, caps, novelties, ignition parts, wall plates, switches, automotive parts, bobbins, spools, etc.

OILS, COTTON-SPRAYING

Proprietary compounds which are applied to cotton (usually in a fine spray) to condition the fibres for the manufacture of yarn and finished cloth, and at the same time improve the working conditions in the mill. Should penetrate the fibres thoroughly and uniformly, should have no detrimental effect on later bleaching and dyeing operations. Should make the fibres more flexible and thus easier to draft; should reduce static; should reduce fly, dust and shedding; prevent breakage of long fibres; produce smoother yarns; in general restore the natural oils and moisture to cotton which has been stored for long periods.

OILS, DRIP

Reilly Tar & Chem Corp, 1615 Merchants Bank Bldg, Indianapolis, Ind — Market 9461

OILS, DRIVING, TANNING

Driving oils are generally considered as those oils which are so treated that they have the property of emulsifying additional quantities of vegetable, animal, or mineral oil. They are generally used in conjunction with an untreated oil in the fatliquoring process, but may also be used alone where it is necessary to have a good penetration of the oil globules. Oils with these peculiar qualities (driving oils) may vary greatly in composition. They may consist of oils which have been sulfated more highly than usual; they may be sulfated oils in which a larger amount than usual of the sulfate groups has been neutralized with an alkali; or they may be sulfated oils in which not only the sulfate group has been completely neutralized but in which varying amounts of the fatty acids have been neutralized. These oils also may contain larger or smaller amounts of oxidized or hydroxylated oils. As stated above, their compositions may and do vary greatly. This necessarily must be true because they are used for various purposes.

OILS, GRAPHITED

Lubricating oils which contain a relatively small percentage of graphite, usually in the colloidal form, which raises the critical temperature, thus permitting the use of smaller quantities of oil. This is desirable at high temperatures where excess oil forms an excess of troublesome carbon. Less oil also entraps less dirt, reduces the fire-hazard.

OILS, INK

Oils employed in ink making are classified as drying, semi-drying, and non-drying, the last being chiefly of petroleum origin. They are sometimes referred to as varnishes when in the finished state. Boiled oils dry much more rapidly than raw oils. Usually ink makers add a drier to the oil or mixture of oils.

OILS, THREADING

Threading operations demand a lubricant and coolant. The oils used must be so made up that great film strength is obtained, rapid penetration and spread afforded, and a decided cooling effect produced. The cutting edge which forms the thread must be kept clean and free.

OPACIFIERS, GLASS

Opacity in enamel and glaze is due to the reflection of light by glassy layers. In order to have maximum opacity, presence of many uniformly distributed reflecting bodies are required—opacifying agents act as the producing crystalline compounds in glazes and enamel.

PAINTS, CASEIN

Coatings in which casein replaces the linseed or other drying oils of ordinary paint. Casein provides the sizing property, whereas fillers supply the covering power. For indoor ornamental work, the usual fillers are lime, powdered chalk, or kaolin. For outside, lime or cement becomes the filler. The paint is prepared by mixing intimately correct proportions of casein, filler and pigment in a mill. The finished powder is mixed with water to correct consistency when used by the consumer. Casein paints provide pleasant effects, are very durable, and with special treatment are washable.

PERFUMES, SOAP

Perfumes used to mask the distinctive odor of fats, and also to give a pleasing smell. Every soap, even the cheapest type of laundry soap, is perfumed. Important factors in soap perfumes are: first, cost, and second, the evaporation of perfumes so that high boiling point essential oils or synthetic aromatics, especially in soaps where the perfume is added to the soap mass while it is still molten must be used. Where the perfume of essential oils would disappear on account of their low boiling point, the use of high boiling point synthetics retains the desired perfume odor. The perfumes must not discolor the soap.

PITCH, CONDUIT

A coal-tar or water gas-tar pitch of special properties, prepared under carefully controlled conditions, for the impregnation of pulp or fibre tubes in the manufacture of fibre conduit. Softening point about 150°-170°F., cube-in-water method.

Reilly Tar & Chem Corp, 1615 Merchants Bank Bldg, Indianapolis, Ind — Market 9461

PITCH, CORE

A powdered, hard, coal-tar pitch used in the production of foundry cores. Softening point about 285°-310°F., cube-in-air method.

Reilly Tar & Chem Corp, 1615 Merchants Bank Bldg, Indianapolis, Ind — Market 9461

PITCH, GREASE-MAKERS'

A soft coal-tar pitch or heavy coal-tar used in compounding greases for heavy pinions and roll-neck bearings. Properties depend upon grease-makers formulae which may include rosin and pine-oil.

Witco M R's
(Hard Hydrocarbon)

Witco M.R.'s are manufactured in two grades:

Grades:	No. 38	Black Diamond
Melting Point:	300-320°F	325-340°F

These extending plasticizers, widely used in rubber compounding, increase the tensile strength and tear resistance of cured stocks especially GR-S, and also increase working qualities of the compound, thus improving pigment dispersion.

PLASTICS, CASEIN

Plastics produced from casein, a product of cow's milk, and one of the first plastics commercially available; is pressed into sheet, tube, and rod form and then cured in a formaldehyde solution, dried, and straightened. Finished product can be sawed, ground, cut, turned, carved, etc., and is available in a large range of opaque, translucent, and mottled color effects.

Amer Firstoline Corp, 420 Lexington Av, N Y — Murray Hill 3-3201

PLASTICS, CELLULOSE ACETATE

Basic characteristics: burn merely like hard rubber, wood, etc., in contrast to nitrocellulose plastics; resistance to impact; excellent coloring effects; high dielectric strength; low heat conductivity; adaptable to remolding, due to the fact that they are thermoplastic, etc. They lack high heat resistance for the same reason.

PLASTICS, ETHYL CELLULOSE

Synthetic products made with ethyl cellulose as a base, which can be easily molded by compression or injection methods: possess great toughness at low temperatures, unaffected by alkalies and dilute acids, extremely light in weight, and can be made entirely non-inflammable by the use of certain chlorinated and phosphate plasticizers; are light-proof and can be used for delicate pastel shades.

Bamberger, A, Corp, Bklyn, N Y
Blum, Paul, Co, Buffalo, N Y

PLASTICS, LAMINATED

Paper or fibre sheets, wood or plywood, impregnated with specially prepared synthetic resins, one built upon the other and bonded together so that any desired thickness can be supplied depending upon the application or use. Find special use in mechanical fields for various types of pinions, gears, wearing rings, plates, etc., in the electrical field, in the textile and synthetic cloth industries, in the decorative and construction field, etc. Standard specifications have been drawn up by the Laminated Plastic Products Group, National Electrical Manufacturers' Association, Publication No. 34-26, June, 1934.

POUR-POINT DEPRESSANTS

Preparations blended with lubricating oils which impart to the latter the ability to flow freely in winter and at low temperatures. It is claimed that the use of such products eliminates the necessity of dewaxing, permits the maintenance of a high viscosity index which in turn means lower consumption, easier starting, and less wear; also maintains high natural resistance to oxidation.

SANTOBRITE*

(Sodium Pentachlorophenate Technical)

Standard Forms: Powder; 1-oz. briquettes; pellets.

Characteristics: Light tan color; non-volatile; comparatively odorless; stable under ordinary atmospheric conditions when stored in a dry place. Soluble in various organic polar solvents. Stable, relatively unreactive but partial conversion to insoluble pentachlorophenol occurs at pH's below 6.8 and insoluble salts are formed by reaction with ions of copper, lead, mercury, zinc, iron and calcium. Non-corrosive to metals. Available as substantially neutral material containing from 0.5 to 0.9% free alkali and as a more alkaline product containing 3-4% alkali.

General Information: A water-soluble industrial preservative, fungicide, algaecide, and herbicide. Used for manufacture of termite-resistant cellulose insulating board and for control of micro-biological activity in paper, paperboard, leather, adhesives, latex and cold water paints; for control of sap stain in green lumber; for control of slime and algae in water systems where the water is not used for drinking or bathing; and in the manufacture of herbicide formulations.

SANTOPHEN* 20

(Pentachlorophenol Technical)

Characteristics: Dark grayish flakes; chlorophenolic odor; crystallizing point 174.0° C. min. Stable; relatively non-hygroscopic; insoluble in water but soluble in most organic solvents, fats, waxes, resins and asphalts. Boiling point is 293° C. at 760 m.m. Relatively inert chemically but reacts with strong alkalis to form water-soluble salts.

General Information: A water-insoluble industrial preservative and herbicide. Used as a moldproofing and termiteproofing agent for wood, cellulosic products, textiles, and as an active ingredient in herbicide formulations.

WOOD PRESERVATIVES
AGRICULTURAL CHEMICALS

A Complete Line of Tested Chemicals for All Wood Preserving Problems • Sap Stain and Mold Control Chemicals • Weed Killers and Insecticides

PENTACHLOROPHENOL—crystals, for the preparation of wood preserving solutions. Efficient in protection of wood from decay and insect attack. Conform to specifications of U.S. Government and American Wood Preservers' Association.

DOWICIDE G—Sodium Pentachlorophenate; for protection against decay, mold and termite attack in fibreboard and insulating materials. Added to pulp during manufacture of the board.

PENTA PRESERVATIVE—for pressure and non-pressure treatment of lumber and wooden structures. A 5% pentachlorophenol solution in selected oil solvents. Controls decay; also termite and other insect attack.

Chapman Weed Killers and Agricultural Chemicals are Unsurpassed.

Insecticides for farm use.

Write for technical bulletins.

PRE-SPOTTERS (Dry-Cleaning)

Specialized soaps for removing stains which would be "set" by heat or not removed in the regular dry-cleaning operation. Stains most likely to become hard-set by heat may be grouped into three classifications: 1. Those which coagulate by heat, including many substances containing albumen such as blood, various foodstuffs, medicine, etc.; 2. Those which are oxidized by heat, including such substances as salad oil, cooking oil, and other unsaturated drying or semi-drying oils; 3. Those which become an integral part of the fibres when heated, including substances containing tannic acid, such as soft drinks, liquor, beer, some wines, fruit juices, grass and flower stains, tobacco, certain perfumes, coffee, tea, medicine, and photographic developing fluids.

RANCIDITY PREVENTIVES (Oils)

Products which stabilize fats and oils, preventing rancidity by decreasing oxidative deterioration. Many patents have been issued claiming such properties for the following products—carotinoid pigments, lecithin, hydroxy-polybasic alipnatic acids, hydroquinone, furfural, unsaturated polybasic aliphatic acids, gum guaiac, oat flour, etc. Where used with edible oils products must have the approval of Food and Drug Administration officials.

REMOVERS, TEXTILE STAINS

Specially formulated compounds for the removal of stains in textile, leather, laundry, and dry-cleaning operations. Since stains are caused by many different products stain removers must be selected for each particular problem encountered. See also Acid Hydrofluoric, Sodium Hydrosulfite, Hydrogen Peroxide. See also Bleaches, Laundry.

P-166 SYNTHETIC RESIN EMULSION FOR COATING PAPER

P-166 is a completely stable polymeric dispersion in water, free of volatile solvents.

P-166 is a new and superior emulsion for coating paper. Its many desirable qualities may be applied to a wide variety of papers. Constant laboratory research and experimentation have indicated that P-166 is a far superior emulsion. Write today for working sample and technical data.

PROPERTIES OF P-166
HIGH GLOSS
LIGHT FAST
WATERPROOFNESS
MAR-RESISTANT

P-166 may be applied by spray, roller or spread coating methods.

ROAD SURFACING COMPOUNDS

Largely tars of varying specifications to meet peculiar problems of road surfacing and maintenance. Such factors as aggregate, weather, traffic volume, grade, drainage, etc., must be considered. Many states, counties, municipalities and the federal government have definite specifications. Reference should also be made to the various specifications of the A.S.T.M. relative to products of this type.

SEALERS, CAN

Sealing compounds used to make air-tight cans (with a removable top) used in food and other industries where it is necessary or desirable to prevent the entrance of air. Very often formulated with rubber latex, or with special waxes or gums together with clays, bentonite, asbestos, alginates, etc. These products are poured into the space between the interlocking edges of the lid and the body of the can. Sealing compounds are also often applied to the lids of glass containers.

SHOCK ABSORBER FLUIDS

Preparations used in shock absorber and knee action units of automobiles, which maintain an even viscosity in varying temperatures; do not corrode pistons, springs and valves, nor form gum or sludge to foul passages, valves, or otherwise disturb the correct resistance within shock absorber or knee action units. For suppliers see Hydraulic Fluids.

SHOE DRESSINGS (Industrial)

Preparations used by shoe manufacturers as a finish coating. Modern shoe dressings may be classified into the following groups:—shellac dressings; casein dressings; split and kip dressings; willow calf dressings; spirit dressings; cellulose ester dressings. Much of the glace kid, both black and colored, and a large proportion of box-calf, box hide and split leathers are treated in the shoe room with shellac dressings. Casein dressings are largely used for box hide and split leathers. Spirit dressings are prepared by dissolving certain natural resins in mixtures of organic solvents with the additions of balsams, oils, and synthetic resins. Cellulose ester dressings are special formulas of nitrocellulose or other solvent forms of cellulose and synthetic resins, usually with a suitable pigment added. See also Finishes, Leather.

SKIN PROTECTING COMPOUNDS

Compounds applied to the hands, and at times to the face and other exposed parts of the body, which serve as a protecting surface against the action of chemicals which burn the skin, or produce sores, eruptions, inflammation, etc. Many such products not only provide a protective layer but have neutralizing effects. Known also as dermatitis preventives.

SOAPS, DRAWING

Soaps for drawing vary in their chemical properties depending on the particular type of drawing they are intended for. Dry drawing of wire is usually done with high titer, so-called neutral tallow soaps. Wet drawing of copper wire is done with emulsions containing soap of low titer, usually made of olive or oleic acid. High titer tallow soaps, so-called neutral ones, are used as emulsifying and lubricating agents in the preparation of drawing compounds for sheet metal.

SOFTENERS, RUBBER

Compounds usually produced from coal-tar hydrocarbons, mineral black oil, coal-tar resins, mixtures of mineral and vegetable oils, petroleum derivatives, turpentine or derivatives, asphaltic products, natural hard bitumen, resins from rosin, etc. Not all compounds possess all the following properties: lubrication, reduction of power consumed in milling operations, improvement of the curing rate, increased dispersion of pigments, improvement of aging qualities, greater smoothness of finish.

SOFTENERS, STENCIL

Preparations which clean stencils, remove the brittleness, and restore the necessary softness so that the proper impressions may be made, clean and with the proper sharpness.

SOFTENERS, TEXTILE

Compounds which impart a softness of handle or feel to finished textiles. Previously, oils, such as castor and olive were used and still are to some extent, but in recent years many compounds and chemicals of a complex nature have been introduced. Many softeners are prepared by condensing oleic and stearic acids with ethylene diamine and its alkyl derivatives. Ortho-phenylene diamine can be substituted for ethylene diamine. Another class includes the thioethers made by reacting saturated or unsaturated monomeric aliphatic compounds or hydroaromatic compounds which contain a mercapto group, with 1:2-propylene oxides, which are substituted in the methyl group by a halogen, or hydroxy, or a mercapto radical.

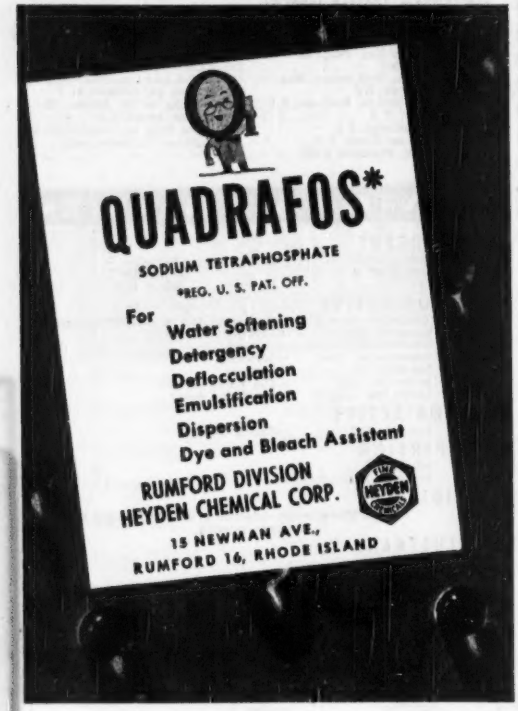
SOFTENERS, TEXTILE CREAM



Proprietary preparations widely used in the cotton finishing industry and generally recommended for finishing cloth whether dyed or bleached, for finishing white piece goods and knitted fabrics, organdie, batiste, gingham, shirtings, also for finishing silk piece goods, or cotton and rayon and cotton and silk mixtures. Basis of many such preparations is sulfonated tallow properly processed.

SOFTENERS, WATER

Substances used to remove soluble compounds of lime and magnesia present in natural waters and which form scale and sludge when used in boilers. Soft water is also essential in numerous industrial operations for the soluble lime and magnesium salts react with other chemicals employed to form undesirable compounds which interfere adversely with operations and processes. The four outstanding processes used for softening water are: distillation, the cold lime-soda process, the hot lime-soda process, and the zeolite process. See also Water Purification Compounds; Zeolites.

Usually alloys of from 50-85% tin, 15-50% zinc and aluminum. Higher melting alloys contain from 73-87% tin, 8-15% zinc, and 5-12% aluminum. Certain alloys contain copper instead of tin, still others have copper and lead as well as zinc, tin and aluminum. A few have a silver content. A representative alloy contains tin, 55%; zinc, 33%; copper, 1%; aluminum, 11%.

SOLVENTS, METAL DEGREASING

Various coal-tar and petroleum solvents have long been used by the manufacturers of small metal parts for degreasing before finishing. Within the past few years vapor-phase degreasing has been introduced in larger units, requiring solvents with low-boiling points, low fire and health hazards. Most often used are low-boiling chlorinated solvents, such as trichlorethylene, ethylene dichloride, carbon tetrachloride, or mixtures of these or other products.

SOURS, LAUNDRY

Compounds employed to neutralize the alkali which the water used for rinsing may contain. Good practice does not countenance the use of sours for neutralizing laundry sodas, soap, or bleach, except such traces as cannot be removed by thorough rinsing. Acetic and oxalic acids are used, but in recent years, specially compounded products, usually containing sodium silicofluoride, have been offered whose action is less harsh and more easily controlled.

SPOT-PROOFING COMPOUNDS

Compounds which when applied to textiles provide an immunity against the formation of spots or rings caused by water or other liquids. Usually the difference between spot-proofing and water-proofing is simply the degree of treatment given. Most women's hosiery goods are spot-proofed. See also Waterproofing Agents.

SPRAY BASES, AGRICULTURAL

Various types of oil emulsions in concentrated form, used in insecticidal and fungicidal work, diluted before application and to which active spray ingredients, such as Bordeaux, lime-sulfur, arsenicals are added. Two general types are: "dormant sprays" used before the trees are in leaf; "summer sprays" used when foliage is present. Also various types of "carriers" of the bentonite (collodial clay type).

SPRAY BASES, CATTLE

Petroleum oils employed in formulation of stock sprays should have no toxic effect nor leave the hair sticky, gummy, dry, harsh, or brittle, and following specifications have been suggested: 1. repellent ingredient (natural material such as pyrethrum or synthetic material) compounded with an oil base. In many instances, a cheap perfuming material is added.

SPREADERS, AGRICULTURAL SPRAY

Many insecticides and fungicides are employed in a water carrier and due to its relatively limited wetting properties substances are generally added which tend to lower the surface tension of the mixture and to cause it to spread more widely, in a thinner film, and to adhere more closely to the surface. Generally such spreaders consist of reaction products of the treatment of aliphatic or aromatic hydrocarbons, alcohols, and similar products with sulfuric acid. Casein in special form is widely used.

STARCHES, PAPER

Starch (commonly from corn) or its conversion products used in the paper industry for beater sizing, surface sizing in the tub, on the calenders, and as an adhesive for laminating sheets into boards and for binding the mineral matter in coating. Natural starch (pearl) is used for beater sizing and as an adhesive in making Bristol board and the like. Modification by hydrolysis is carried out by addition of acid to starch suspended in water and warming the mixture. By varying the time, temperature and amount of acid, the properties of the starch, particularly its viscosity, can be controlled within narrow limits and several different products (the thin boiling starches) are produced in this way. Corn syrup (glucose) and corn sugar are produced by this operation carried on at much higher temperatures. Heating dry starch with acid produces the commercial dextrins (white, canary, etc.). Modification by oxidation is carried out by addition of an oxidizing agent and results in thinner, clearer, more gelatin-like solutions than those produced by acid hydrolysis. Starches improve scuffing, quality, and improve mullen, and to a limited extent, improve fold, finish, sizing, rattle and fuzz control.

STIFFENERS, TEXTILE

Compounds which impart a desirable stiffness and waterproofing effect to certain finished textiles. For many years weak solutions of certain natural gums in organic solvents were employed and more recently artificial resins of the vinyl, acrylate, phenol-formaldehyde, and urea-formaldehyde types have been introduced. Certain of these resins when applied in special concentrations provide the creaseless quality to linens, neckties, draperies, shirt collars, etc.

SULFATED HIGHER ALCOHOLS

Produced by catalytic hydrogenation of natural fats and oils in which the fatty acids are reduced to the corresponding fatty alcohols and these alcohols reacted with sulfuric acid, neutralized with caustic soda. These products are used in the place of soap in many fields, work equally well in hard water or soft water; called "soapless soaps" because they do not lather and leave no scum when used with hard water. Used as a detergent in home and power laundries, as a wetting, penetrating, scouring, dispersing, and emulsifying agent in many industries, particularly in the textile, dry-cleaning, paper, and leather fields; used extensively in hair shampoos.

SULFONATES

Considerable confusion exists in the industry between the corresponding sulfates and sulfonates. The sulfates are the true esters of the corresponding higher fatty alcohols, wherein the sulfur atom of the acid group is united to the end carbon of the alcohol through an oxygen linkage, as—C.O.SO_3Na. The sulfonates are true sulfonates,

TANNAGES, ONE-BATH

Leather is chrome-tanned by two processes: the two-bath and the one-bath methods. In the former skins are immersed in a bath of either sodium or potassium bichromate and an acid, usually muriatic and a second bath to reduce the chromic acid to an inert oxide, usually accomplished in a drum-tumbler containing a solution of sodium hyposulfite and a weak acid, usually muriatic. In the one-bath method the skins are soaked in a prepared liquor containing basic chromium sulfate or chloride, obtained by a mixture of chrome alum and soda or bichromate of potash or soda, or by reducing chromic acid with glucose or sulfur dioxide.

TARS, ROAD

Road tars are products specially prepared by blending, distilling and fluxing suitable coal tars and water gas tars and their oils to meet specifications for the particular intended use. The characteristics of the tars vary with the type of road construction for which they are to be used. They are used for stabilizing and priming the subgrade, for surface treatment, penetration macadam, mixed-in-place and cold laid-premixed construction, and for seal coats. Specifications for road tars have been set up by national organizations such as the American Society for Testing Materials, American Association of State Highway Officials, and Bureau of Public Roads, and by most states and by many local organizations.

TONERS, LITHOGRAPHIC

Unadulterated organic and inorganic colors, dispersed in a suitable vehicle, principally linseed oil, suitably bodied. In a few specific cases other vehicles, such as perilla oil, tung oil, etc., are used. When these oils are used they do not enhance the value of the finished product as far as brilliancy is concerned. They only serve their purpose insofar as resistance to alkali, acid and weather conditions are concerned.

TONERS, PHOTOGRAPHIC

Toners are metallic salts or organic dyes which are used for coloring photographic positives by replacing all or part of the silver in the image. In a toned print, only the darker portions are colored, the highlights remaining clear; while a tinted print is colored uniformly over the entire surface. Most toning processes require an intermediate mordanting operation.

TRANSFORMER COMPOUNDS

Usually the higher petroleum fractions, more or less identical with lubricating oils; free from moisture and acid. Specialised preparations are also marketed. Purpose is to act as a cooling and insulating medium. Should have high dielectric strength, low freezing point, low viscosity, stability; and non-inflammability is still another highly desirable characteristic.

VARNISHES, LAMINATING

Specialized varnishes formulated from synthetic resins and appropriate solvents and which are used to impregnate the laminating fabric which is either paper or cloth. Impregnating is accomplished on special machines. By means of rollers, the fabric passes continually through a dip tank, or other device by which the varnish is applied in a uniform coating. The varnish-laden sheet passes from the dipping operation to a dryer, usually of the lower type where the solvent is evaporated. After being dried of the solvent, the processed web is cut into sheets of convenient size. A large number of these sheets are then superimposed and placed in a hydraulic press. Under the action heat and pressure, a hard dense, rigid plate is formed. The mass of resinoid-impregnated layers has been completely polymerized and transformed into a hard, dense board which will not dilaminate, cannot be softened by heat, is non-hygroscopic and possesses unusual mechanical and dielectric strength. Only synthetic resins that are capable of becoming permanently infusible and insoluble can be used in laminating varnish formulation. Laminating varnishes must be highly dielectric and heat-resisting, impervious to oils, water, solvents and most chemicals.

MERCK

more than a decade of

Vitamin Leadership

For more than a decade, the name Merck has been identified with leadership in the synthesis, development, and large-scale production of pure vitamins.

The following list of contributions in the vitamin field made by Merck chemists and their collaborators emphasizes the outstanding role played by Merck & Co., Inc. in the development of these vitally important substances:

1934 Ascorbic Acid Merck (U.S.P.) was made available by Merck & Co., Inc.

1936 Vitamin B_1 was synthesized in the Merck Research Laboratories.

1937 Thiamine Hydrochloride Merck (U.S.P.) was made available in commercial quantities.

1938 Nicotinic Acid Merck (U.S.P.) (Niacin) and Nicotinamide Merck (U.S.P.) (Niacinamide) were made commercially available.

Riboflavin Merck (U.S.P.) was the second pure crystalline vitamin to reach commercial production during that year.

Alpha Tocopherol (Vitamin E) was identified and synthesized by Merck chemists and their collaborators in other laboratories.

1939 Vitamin B_6 was synthesized in the Merck Research Laboratories.

1940 Vitamin B_6 Hydrochloride Merck (Pyridoxine Hydrochloride) became available in commercial quantities.
Alpha Tocopherol Merck (Vitamin E) was made commercially available.

Vitamin K_1 Merck (2-Methyl-3-Phytyl-1,4-Naphthoquinone) was made commercially available.

Menadione Merck (U.S.P.) (2-Methyl-1,4-Naphthoquinone), a pure chemical having marked Vitamin K activity, became available in commercial quantities.

Pantothenic Acid, member of the Vitamin B Complex, was identified and synthesized by Merck chemists and their collaborators in other laboratories.

Calcium Pantothenate Dextrorotatory, a biologically active form of Pantothenic Acid, was made commercially available by Merck & Co., Inc.

1943 Biotin, member of the Vitamin B Complex, was synthesized in the Merck Research Laboratories.

1944 Biotin Merck was made commercially available by Merck & Co., Inc.

1948 Crystalline Vitamin B_{12}, anti-anemia factor in pure form, was isolated in the Merck Research Laboratories.

1949 Crystalline Vitamin B_{12} Merck was made commercially available.
Thiamine Mononitrate Merck, a more stable form of Vitamin B_1, was made commercially available.

1950 Synthetic Vitamin A Merck was made commercially available.

WATERPROOFING AGENTS, ELECTRICAL

Compounds which serve to seal coils of various types already insulated by varnish or enamel. These compounds are generally liquids of a high viscosity and non-impregnating properties serving to effectively seal the complete formed coil with a tough shell of water and moisture vapor proof material. These coatings are of two types, either synthetic rubber or cellulose derivative both particularly formulated to offer minimum change in electrical properties after either long immersion in water or long subjection to high humidity. They dry by evaporation of the volatile solvents generally in a few minutes; from one to three coats are required depending on the nature of the coil.

Ornite Chem Co, 38 Sansome St, San Fran, Calif — Exbrook 2-0923

WATERPROOFING AGENTS, LEATHER

Preparations used to render leather impervious to water, dampness, etc. Two types are marketed: 1. For direct incorporation in the leather in the processing operation; 2. Applied as a protective coating to finished leather.

WATERPROOFING AGENTS, TEXTILE

Specialized compounds which make fabrics water-tight; usually formulated from fats, waxes, etc., applied in organic solvents, water emulsions in single baths, or aluminum salts and soap applied by the two bath method. Stiffer fabrics, as for example, shower curtains, usually require rubberizing processes, application of plasticized lacquers, and oilskin formulas. No sharp distinction exists between water-proofing and spot-proofing agents.

WAXES, BATTERY

Two classes. First for sealing storage batteries. These are usually combinations of air or oil blown asphalts, pitches, and flux oils. Usually embody maximum adhesiveness, and elasticity to adjust themselves to the two extremes of temperatures, as well as the contraction and expansion of the composition rubber cases in general use. Dry battery seals are usually based on resins, treated or untreated, in combination with silica, talc, clays, or other mineral fillers. Used in sealing batteries for flashlights, hearing aids, bell ringing, and starting marine motors.

WAXES, CASTING

Special waxes used by electrotypers for making wax molds of the original type. For making large editions the graphite wax mold is hung in a nickel bath first and then coated with copper. Casting waxes are used similarly in the manufacture of phonographic records; also employed by sculptors; also in a wide variety of situations where a mold is first necessary before electroplating operations are performed.

WAXES, EMULSIFYING

Emulsifying waxes in general are the stearic and palmitic acid esters of glycerin and the glycols. Amines and ammonia are also used occasionally as bases for the esterification. While they are not true waxes according to the generally accepted definition of waxes, they exhibit many wax-like properties. They are waxy in appearance and feel, and have a fairly sharp melting point. They blend easily with other waxes, oils, etc. They are, however, dispersible in hot water, forming on cooling, while stirring, stable emulsions of varying consistency. They are also excellent emulsifying agents for waxes, oils, resins and solvents, particularly for the manufacture of cream and paste emulsions.

WAXES, INSULATING

Mechanical mixtures of waxes, asphalts, stearine pitches, petrolatums, oils and resins—available in a wide range of softening points, degree of hardness, and other desired physical characteristics. Finished compounds embody high dielectric strength, and moisture, acid, alkali, or oil resistance. Used for impregnating electrical coils, potting and dip-sealing of condensers and transformers.

WAXES, SEALING

Specially formulated compounds largely used on paper and bottle caps, also to seal valuable documents and packages for storage and shipment. Term sealing wax is largely a misnomer for few commercial products marketed now actually contain any wax, or if they do, its use is only that of a filler. Sealing waxes are now generally prepared from plasticized resins with inorganic fillers and pigments. Primary requirements are smoothness of texture, brilliancy of gloss, absence of obnoxious odors upon melting, wide range of softening points, rehardening without the appearance of a rubbery behavior, retention of color and fracturing without crumbling. Generally there are two types:—1. To be heated over a direct flame; 2. Bulk to be heated in pots, electric or gas.

WAXES, TANNERS'

Certain waxes are used by tanners both in the tanning process and and to give pliability. They are selected with a view of producing special results and to impart certain characteristics to the leather. Waxes are in certain cases, used as the emulsifying agent in fat-liquoring formulation, and in the compounding of softening and stuffing greases; also "wax resists" are employed in the production of antique and two-toned leathers.

WETTING AGENTS

Products possessing properties of wetting, penetrating, emulsifying, softening, etc., extensively used in the textile, leather, dry-cleaning, paper, rubber, detergent, cosmetic, fields, in agricultural sprays, shampoos, etc. Most common are the sulfonated oils, sulfonated higher alcohols, the true sulfonates, pine oils, etc. Within the past few years a number of complex organic preparations have been introduced. Wetting power is based not only on the reduction of surface tension of a solution, but also upon the reduction of the interfacial tension between the solid and the liquid.

SURFAX

The Houghton line of wetting, rewetting, penetrating and softening agents for wet processing.

ZEOLITES

Substances which occur in nature as green sand and also produced synthetically and used to render water soft by exchanging the hardness-forming bases, calcium and magnesium compounds found in all natural waters, for sodium bases. For example, if calcium sulfate is in the hard water, when the water comes in contact with the zeolite granules, the calcium is taken up by the zeolite, forming calcium zeolite, and the sodium goes into the water, forming sodium sulfate. As calcium sulfate is scale-forming and sodium sulfate does not form scale, the net result is that a scale-forming substance has been transformed into a non-scale forming substance. Chemical Industries

Sound, down-to-earth information for chemical men!

No abstruse, long-winded, theoretical treatises to wade through in Chemical Industries—but pithy, practical, dollars-and-cents material to help technical and business men in the chemical process industries do a better job—Yes, there's gold in CI's columns for YOU and every other chemist, chemical engineer, plant manager, research director and busy executive!

Regular monthly departments and special features

Newsletter—news before it's news, tells who's going to do what and why.

What's New—brief, interpretive discussions of new developments—highlights background, potentialities, immediate and future effect on business.

Special Features—specific phases of the various branches of the chemical process industries authoritatively presented by top men in each field—subjects chosen for timeliness and importance.

New Products and Processes—descriptive sketches—characteristics, uses, source—Technical Data Service in conjunction with this department—handy key system to obtain all available information on particular product or process.

New Equipment—has its own special department—dittos in style New Products and Processes Department.

Patents and Trademarks—digest of current chemical patents classified by industry—a real time-saver.

News of the Month—Chemical News in Pictures, General News, Canadian News, *Chemical Specialties News*, Chemical Markets, Chemical Economics & Statistics, Current Prices.

Packaging and Shipping—new designs, methods, materials—government regulations.

Booklets & Catalogs—lists available free chemical and equipment booklets—convenient coupon system to send for them.

Laboratory Notebook **Industry's Bookshelf**

Special Annual Issues

New Chemicals—New Equipment Issue—a catalog of new chemicals, chemical specialties and equipment items introduced during the year, bound into special issue once a year.

Annual Buyers' Guide—800-page directory of complete buying information, listing over 30,000 chemical and equipment items with their sources of supply, trade names, physical properties, formulas, etc. Bound separately for convenient, all-year-round, daily use, but included with year-end issue of Chemical Industries.

No other magazine presents so complete a picture of the chemical process industries.

No other chemical magazine carries so much information so early.

No other magazine demands so little reading time for such extensive news coverage.

CI is the chemical magazine of industrial news significance—

CI not only presents the news in short, clear synopsis—but

CI interprets chemical developments and trends for their present and future significance.

If you want helpful, valuable, profitable information about the chemical process industries, mail this coupon to

Technical Data

A selection of miscellaneous tables collected from various sources and published to provide a handy reference for frequently needed technical information.

Table of Conversion Factors*

CU-GA

Data are arranged alphabetically.

Unless designated otherwise, the English measures of capacity are those used in the United States, and the units of weight and mass are avoirdupois units.

The word gallon, used in any conversion factor, designates the U. S. gallon. To convert into the Imperial gallon, multiply the U. S. gallon by 0.83267. Likewise, the word ton designates a short ton, 2,000 pounds.

The figures 10^{-1}, 10^{-2}, 10^{-3}, etc. denote 0.1, 0.01, 0.001, etc., respectively.

The figures 10^{1}, 10^{2}, 10^{3}, etc. denote 10, 100, 1000, etc., respectively.

With respect to the properties of water, it freezes at 32°F., and is at its maximum density at 39.2°F. In the conversion factors given below using the properties of water, calculations are based on water at 39.2°F. in vacuo, weighing 62.427 pounds per cubic foot, or 8.345 pounds per U. S. gallon.

"Parts Per Million," designated as P.P.M., is always by weight and is simply a more convenient method of expressing concentration, either dissolved or undissolved material. Usually P.P.M. is used where percentage would be so small as to necessitate several ciphers after the decimal point, as one part per million is equal to 0.0001 per cent.

As used in the Sanitary field, P.P.M. represents the number of pounds of dry solids contained in one million pounds of water, including solids. In this field, one part per million may be expressed as 8.345 pounds of dry solids to one million U. S. gallons of water. In the Metric system, one part per million may be expressed as one gram of dry solids to one million grams of water, or one milligram per liter.

In arriving at parts per million by means of pounds per million gallons or milligrams per liter, it may be mentioned that the density of the solution or suspension has been neglected and if this is appreciably different from unity, the results are slightly in error.

SIFT PROOF MOISTURE PROOF TOUGH AS A PIG'S NOSE!

Fulton W. P. P. L. bags cost less than rigid containers, save on storage space, reduce cost of handling and shipping. Made from durable, tough burlap or cotton material laminated with waterproof adhesive to a special, crinkled Kraft paper lining. Positively sift proof and moisture proof, and much stronger than unlined textile bags. **Fulton** W.P.P.L. bags (waterproof paper lined) are ideal containers for export and domestic shipments of hygroscopic materials, lawn and garden mixtures and other special fertilizers.

Investigate the advantages of these modern containers for your product. Write the Fulton branch nearest you.

NATIONALLY RECOGNIZED QUALITY

The high quality of Fulton Multiwall paper bags has won broad recognition from the largest users in many industries, who have favored us with orders. Our new modern plant in New Orleans is producing all types of Multiwalls. Give us a call on your next order.

Drums and Barrels

Hackney Welded Type Drum, with Toggle-tite quick-action closure.

Hackney Seamless Bilged Barrel, with bolt-type closure.

Hackney *returnable* drums and barrels assure a container supply month after month. Full unobstructed opening permits easy removal of contents. Chime construction assures easy and thorough cleaning. No hard-to-clean crevices. The closure—with either Toggle-tite or single-bolt fitting—holds the head airtight at the top outward curled edge of the barrel. There is no chance of leakage or entrance of foreign matter while in transit. Made to conform to I.C.C. specifications. Write for complete details.

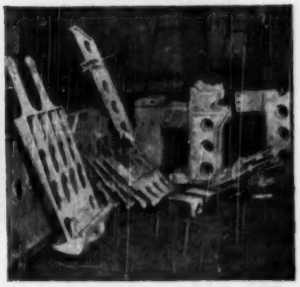
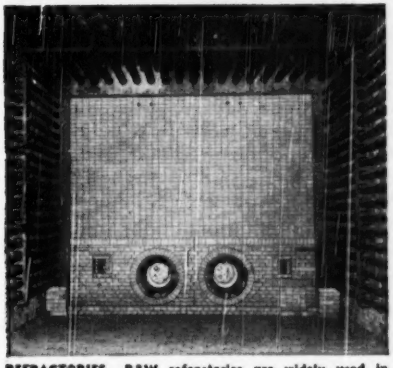
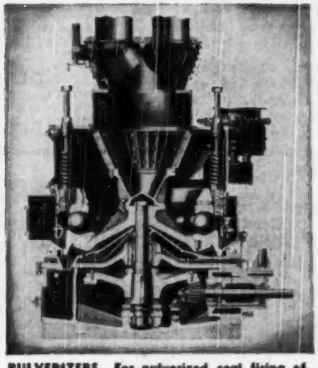
B&W EQUIPMENT for the PROCESS INDUSTRIES



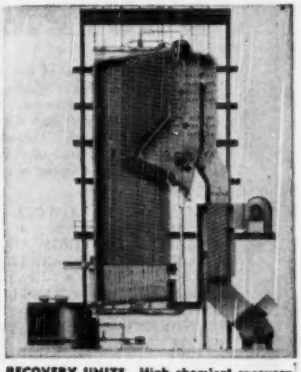
BOILERS. The complete line of B&W boilers and related equipment meets all requirements for dependable, low-cost steam generation in any combination of capacity, pressure, temperature, fuel and space conditions.



TUBES. Seamless and Welded Tubes are made by B&W in a full range of analyses from low carbons to high alloys, including stainless steels, to meet any service condition in high-temperature, high-pressure applications in chemical processes.



PRESSURE VESSELS. Sizes and shapes of dependable welded construction for any process requirement can be fabricated by B&W from carbon, alloy or clad steels. All vessels are x-ray inspected and stress relieved.

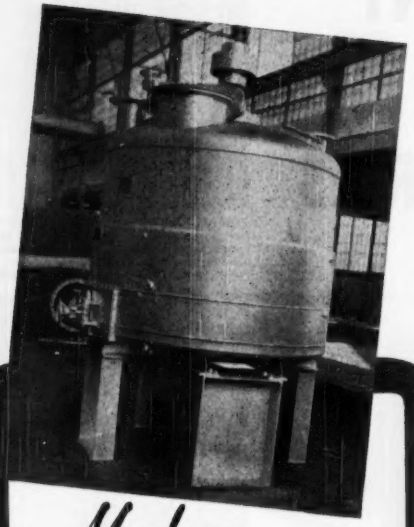


ALLOY CASTINGS. Parts for process equipment requiring high strength, and resistance to abrasion and heat are made in a wide variety of shapes and analyses in B&W's foundry.

REFRACTORIES. B&W refractories are widely used in chemical process furnaces. Long life, low maintenance, fuel economy and continuous furnace operation account for their extensive use.

PULVERIZERS. For pulverized coal firing of boilers and furnaces, and for raw material grinding, B&W Pulverizers offer many installation, operating and maintenance advantages.

RECOVERY UNITS. High chemical recovery, dependable steam supply and wide operating flexibility are obtained at low operating cost with B&W Tomlinson Recovery Units.



The various lines of B&W equipment shown on these pages are contributing importantly to the present high standards of operating efficiency and economy now being attained in modern process plants. For complete information, write to our nearest branch office.

PROCESSING EQUIPMENT

Listed here are some of the many standard and special types of BUFLOVAK, BUFLOKAST, and BUFLOWELD equipment. Obviously, a line so extensive in type and application cannot be fully described here. However, bulletins completely describing the individual pieces of equipment are available upon request.

ACID EGGS • AUTOCLAVES • BREWHOUSE EQUIPMENT • CAUSTIC POTS CHEMICAL CASTINGS • CONDENSERS DISTILLATION APPARATUS • DRYERS EVAPORATORS • FATTY ACID STILLS IMPREGNATORS • KETTLES • NITRATORS NITRIC ACID RETORTS • PILOT PLANT EQUIPMENT • REDUCERS • SOLVENT RECOVERY APPARATUS • SULPHONATORS • VULCANIZERS • DOPP KETTLES

BUFLOVAK maintains a Research and Testing Plant to assist customers in the solution of processing problems and to develop more efficient production methods and improved finished products. These facilities can save you time and money. Results are definite. Take advantage of these facilities and a highly specialized and experienced technical staff.

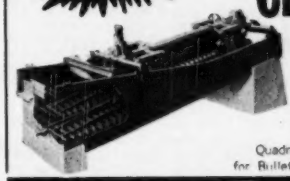
DENVER *Cross Flow* CLASSIFIERS



There are many applications for this classifier in chemical and industrial processes, as well as in the metallurgical field. This unit does not have any bearings under the liquid to wear out or contaminate the pulp. This makes it an ideal classifier. Write for Bulletin No. CSC-8

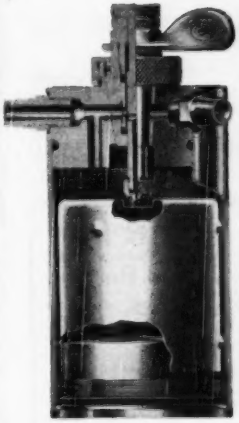
EMIL GREINER CARTESIAN MANOSTATS



For The Most Effective *Automatic* VACUUM and PRESSURE CONTROL

Laboratory Model For Automatic Vacuum and Pressure Control

- Maintains vacuum setting even after shutting down system.
- Operation is simple and fool proof.
- High Sensitivity.

One of the most amazing instruments ever developed. For complete information write for Bulletin CM 97.

High Capacity Model for Automatic Vacuum and Pressure Control

- So Simple Anyone Can Operate It!
- Just Set It and Forget It!
- Slashes Operating Costs!

For complete information on this revolutionary new manostat, based on a principle never before used in industry, write for Bulletin ICM-96, giving full performance and operating data.

MODEL No. 6
Catalog No. G 15074 and G 15075

G 15074 *All Stainless Steel, delivered with mercury and directions for use.* **$37.50.**

G 15075 *Same as G 15074 but with clear plastic (Tenite II) body tube for visual observation of float.*

MODEL No. 5
Catalog No. G 15080
(Pat. No. 2,482,167)

Complete with 3 interchangeable orifices and mercury, **$95.00.** *Size: 7½" overall, Diameter: 3¼". Weight: approx. 8 lbs.*

MERCOID

AUTOMATIC CONTROLS FOR HEATING, AIR CONDITIONING, REFRIGERATION AND VARIOUS INDUSTRIAL APPLICATIONS

THE ONLY 100% MERCURY SWITCH EQUIPPED CONTROLS

The distinguishing feature of Mercoid Controls is the exclusive use of Mercoid hermetically sealed mercury switches. These switches are not subject to dust, dirt or corrosion, thereby assuring better performance and longer control life. The items shown below are but a few miscellaneous items. See Catalog No. 700 for the complete line.

Pressure Controls | Temperature Controls | Float Operated Controls | Transformer-Relays

Low Voltage Thermostats | Line Voltage Thermostats | Liquid Level Control | Oil Burner Safety and Ignition Controls

If you have a problem involving the automatic control of pressure, temperature, liquid level, mechanical operations, etc., it will pay you to consult Mercoid's engineering staff — always at your service.

COMPRESSED GAS CYLINDERS

Widely used for shipment of Acetylene, Ammonia, Chlorine, Liquefied Petroleum Gases, Oxygen, Carbon Dioxide, Methyl Chloride, Cyclopropane, Freon, etc. They meet I.C.C. specifications and special requirements of users.

Hackney Cylinders are entirely seamless or of two-piece welded type. They have been designed with the shippers' requirements in mind—constructed to give lowest transportation costs, full protection to product, ease of handling, and utmost resistance to transportation and handling abuse. Write for full details.

INDUSTRIAL'S
ION EXCHANGERS
Pure Water at Lower Costs

Industrial's ion exchangers deliver the chemical equivalent of distilled water, but at only a fraction of the cost of distillation. No heat and no stills are required - the dissolved mineral salts are removed by a simple chemical action and absorption in passing the water through beds of ion-exchange resins. Compact, self-contained units are easily installed and operated.

There are also many other applications of Industrial ion-exchanger units in the chemical industries.

A Two-Bed INDUSTRIAL Ion-Exchange Unit. Standard two- and four-bed units available with capacities of 200 to 1000 gph. Special units of any capacity engineered to requirements.

Write for full information and recommendations.

Hackney

2-PIECE ACID DRUMS

Hackney Acid Drums have no longitudinal or chime seams . . . only one circumferential butt weld located between and protected by two I-bar rolling hoops. Bung failures are minimized by special heavy forged spuds attached by a two-pass weld. After fabrication, special heat-treating increases resistance to corrosion. Extra strength and prolonged life are added by use of reinforced chime protectors. Smooth interior is free of cracks and crevices, assuring easy cleaning.

Designed for long life, Hackney Acid Drums are effectively reducing costs for shippers of acids and alkalies. Write for complete information.

FIBRE DRUMS

FOR DRY BULK PRODUCTS

STAPAK

Stapak drums are ideal low cost containers for many dry products. Made with convenient full open top for rapid filling and easy dispensing. Stapak drums are sturdy in construction and comply fully with requirements of Consolidated Freight Classification regulations. Also comply with all pure food laws and are ideal for food products and chemicals. Sizes range from 2 to 32 gals. Acceptable weights to 200 lbs.

FIBERPAK

Fiberpak drums have the same sturdy construction as Stapak but are designed for heavy duty service. Bursting tests range from 950 to 1850 and more pounds per square inch. Also comply with Interstate Commerce Commission regulations covering class "B" (ICC-21A) poisons, and other dangerous commodities. Sizes range from ¾ to 67 gals. Acceptable weights to 400 pounds.

LEVERPAK

Leverpak drums have the advantages of Stapak and Fiberpak. Outstanding characteristics are their light tare weight, freedom from contamination, sift proof seal, pilfer proof locking band closure. Interior and exterior treatments or linings can be made to meet your special requirements.

They also comply with I. C. C. regulations for class "B" poisons. ● Sizes range—12 to 75 gals. Acceptable weights to 400 lbs. All carriers assume the same responsibility for merchandise packed and shipped in Stapak, Fiberpak and Leverpak, as in wood or steel of like capacity.

Write for information covering these shipping drums.

BUFLOVAK

DRUM DRYERS

BUFLOVAK Vacuum Double Drum Dryers safely dry at low temperature a wide range of heat-sensitive materials.

DRUM DRYING is an economical and continuous method for producing dry materials at low operating cost, directly from liquids containing solids in solution or suspension. This modern process is applicable to a wide variety of materials, including chemicals, dyes, pharmaceuticals and food products. It offers the added advantage of controlling, within certain limitations, the physical characteristics, appearance and texture of the dry product, demanded by market or process requirements.

The process of drum drying consists of applying the liquid material to a revolving heated drum, where the moisture is quickly evaporated, during a partial revolution of the drum. Then the dry material is removed by a stationary knife. This basic operating principle is used with various modifications on all types of BUFLOVAK drum dryers. New developments and refinements, that are exclusive and patented BUFLOVAK features, bring the economies and advantages of drum drying to a constantly growing list of products.

To meet successfully these widely differing requirements, BUFLOVAK Dryers are built for vacuum and atmospheric operation; in single, double drum, twin drum and multiple stage types. The standard sizes meet practically all capacity requirements.

EVACTOR

STEAM JET VACUUM PUMPS

Croll-Reynolds Steam Jet Evactors are made in single, two, three, four, and five stage units for any vacuum up to a few microns absolute. More than 10,000 installations are serving all types of condensers and chemical processing units. There are no moving parts which means extreme simplicity and dependability. Constant research and development by an organization which has specialized on this equipment for over thirty years has also provided exceptional efficiency.

CHILLED WATER FOR PROCESS COOLING

Croll-Reynolds Chill-Vactor equipment uses the Evactors described above to chill water and aqueous solutions by evaporative cooling. The total capacity of Chill-Vactors installed to date is equal to over 25,000 tons of ice per day. This equipment is furnishing chilled water for air conditioning, chilled liquors for chemical process work and for chilling porous solids and wetted surfaces.

BUFLOVAK
LOW-TEMPERATURE EVAPORATORS

Operating at extremely low temperature—as low as 58° F.—and at safe pressures, the new BUFLOVAK Low-Temperature Evaporators protect the delicate quality of many food and chemical products. Concentration is quick, safe, and with a high recovery of solids. Automatic controls simplify operation, reduce labor to a minimum, and give uniform results even to the density of the product. And, BUFLOVAK Low-Temperature Evaporators are sold outright with protective performance guarantees.

BUFLOVAK

EVAPORATORS

FOR THE RECOVERY OF SOLIDS . . .

BUFLOVAK Vertical Concentration Evaporators are simple in design and construction and provide maximum recovery of solids. A high rate of evaporation per square foot of heating surface results from improved heat transfer, accomplished by proper steam distribution, correct velocity of steam and thorough removal of non-condensable gases and condensate.

FOR CLEAR CONCENTRATES . . .

Continuous evaporation, with the production of a clear concentrate and the continuous removal of salt crystals, is effectively accomplished with the BUFLOVAK Double Effect Forced Circulation Evaporator, which continuously separates the crystals by a new type, patented, salt separator.

FOR ACID RECOVERY . . .

PUFLOVAK Evaporators offer operating economies and efficient, dependable, long life performance. They are designed especially for this service and built of lead, bronze, or other materials suited to the particular application.

FOR SOLVENT RECOVERY . . .

In the manufacture of medicinal and drug extracts and in the extraction of active principles from vegetables or animal products, a dilute solution is obtained which requires concentration under conditions of maximum solvent recovery and minimum entrainment loss. BUFLOVAK provides these advantages in evaporators designed for economical construction in stainless steel, aluminum, nickel, etc.

FOR FOOD PRODUCTS . . .

BUFLOVAK Evaporators of stainless steel profitably meet the exacting requirements of producing concentrated food products of high quality. They are built in sizes and types to meet every operating condition, including multiple effects and save 50% and upward in steam and cooling water.

FANS TO EXHAUST ACID FUMES

Durco fans provide an efficient, permanently corrosion-resisting means of removing acid fumes. All parts in contact with the fumes are made of Duriron, Durichlor (high silicon irons), Durimet or other Durco alloys, which require no coating or painting for protection. Capacities from 50 to 5,000 cfm. These fans require no more attention than an occasional oiling of the motor. Write for bulletin 1103.

INDUSTRIAL'S FILTERING SYSTEMS

for All Solution Clarification

Industrial's filters are conservatively rated on capacity. The filtration area, the sludge holding capacity of the filter chamber, and the pump characteristics—all affect the operation and capacity of the filtering system. Industrial's design of filters provide low-cost filtration in either continuous or intermittent service.

Industrial's air-wash cleaning method permits rapid cleaning without opening the filter. Opening is required only for replacing the filter cloths or for periodic inspection. Down time is reduced to a minimum with a saving in labor and cost.

A Typical Industrial Stationary Filter System. Standard models — portable and stationary types — are available in capacities of 100 to 15,000 gph. Special filters are engineered to meet unusual requirements.

Controlled Heat to 1050° C.—Built-in Controller and Indicating Pyrometer—Low Initial Cost—Economical Operation.

These compact, clean heavy-duty furnaces meet the need for an inexpensive, economical unit for all laboratory operations such as drying of precipitates, ash determinations, fusions, ignitions, etc. The maximum safe working temperature is 1000° C. (1832° F.). For intermittent periods of short duration the furnaces may be operated at a maximum temperature of 1050° C. (1932° F.). Three sizes.

A Continuous Record of Gas Analysis . . .

The Cambridge Gas Analyzers continuously analyze and **simultaneously** record up to as many as six constituents of a mixture of gases. No intermittent sampling . . . no fragile glassware.

Single- and multi-point instruments are available for a wide variety of applications, including the determination of

Carbon Dioxide in flue gases
Oxygen in flue and stack gases and in furnace atmospheres
Dissolved Oxygen in boiler feedwater
Hydrogen in steam
Carbon Monoxide, Nitrogen, Argon and many other gases can be determined by available Cambridge analyzers

DO YOU KNOW..
That it's possible

TO GO THROUGH A HEATING SEASON WITHOUT UNIT HEATER MAINTENANCE EXPENSE not only one heating season but many, providing that yours is a GRID installation? It's possible, and is being done by major chemical plants who have investigated and installed GRID equipment. It's possible because:

GRID cast iron construction withstands corrosive fumes.

GRID wide fin spacing facilitates easy cleaning.

GRID will withstand steam pressures up to 250 lbs., and is free of electrolysis.

GRID fins are cast integral with the steam chamber assuring even distribution of heat. It's not possible for GRID fins to come loose from the steam chamber to cause loss of heating efficiency.

GRID design incorporating proper fan sizes, motor speeds and outlet temperatures results in a properly balanced heating unit.

No other unit heater incorporates these features that are vital to proper and efficient chemical plant heating.

INVESTIGATE today GRID systems of high pressure unit heaters, blast coils, and radiation . . . the answer to maintainance-free heating in the chemical industry.

TRIPLEXD SOLVENT HOSE

For All Petroleum Solvents

• A new and better solvent hose • Lighter and more flexible than an all-metal hose; more serviceable than an all-rubber hose • Flexible steel lining, sealed with solvent-resistant tube • Tube compounded without plasticizers, remains pliable, non-discoloring, will not flake off • Closely woven cotton cover protects tube against internal pressure and external abrasion.

DOPP KETTLES

Seamless Jacketed

with the

Positive Scraping Agitator

***that* CLEANS AS IT MIXES**

DOPP Seamless Jacketed Kettles embody several exclusive constructional features which increase production, lower operating costs, and insure a uniform quality of product. They are equipped with a special type agitator that cleans as it mixes. In combination with other features, the heating surface is kept thoroughly free from accumulated material. The result is greater unit capacity—an increase in heat transfer, in some cases, as much as five times—quicker processing—substantial savings in power—thorough mixing—and the complete discharge of processed batches, thus eliminating reworking.

TYPE FOR EVERY PURPOSE

DOPP Kettles are available for pressure or vacuum operation and in a wide range of types and sizes from 5 to 1700 gallons capacity.

POSITIVE TEMPERATURE CONTROL OF PRODUCT

Patented DOPP Thermocouples indicate accurate temperatures of the material, regardless of the temperature of the kettle wall.

Not Just Pieces of Glass...
But Instruments of Integrity

Accurate under any and all conditions, Greiner precision instruments require no time-consuming checking or testing. Instantly, they are ready for the work at hand. The name Greiner is the chemist's assurance of the positive integrity of his instruments.

We carry a complete stock of laboratory apparatus and reagent chemicals. In addition to our glass blowing, engraving and grinding shops, we also maintain on our premises complete machine and metal working shops which enable us to construct special apparatus of any type.

Cambridge pH Meters—3 Models

line operated—accurate!

Direct-Reading Industrial Model

Cambridge pH Meters offer many new and important advantages. All are A.C. line-operated; "warm-up" delays are eliminated. They are conveniently *and safely* portable. Laboratory and Research models use electron-ray tube for precise null-point indication. Industrial model is direct-reading, continuous-indicating; ruggedly-built for plant applications.

Industrial Model: Accuracy .10 pH, range 0 to 14pH. **Laboratory Model:** Accuracy .05 pH, sensitivity .01 pH, readings reproducible to .02 pH. Range 0 to 14 pH; 0 to 1000 mv. **Research Model:** Accuracy .02 pH, sensitivity .005 pH, readings reproducible to .01 pH. Range 0 to 14 pH; 0 to 1200 mv.

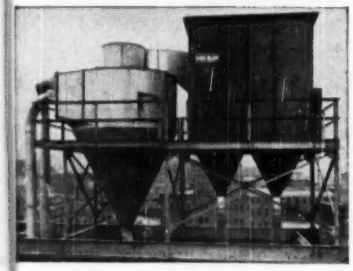
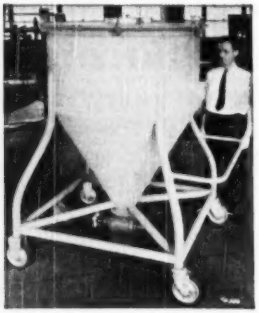
THE KIRK & BLUM MANUFACTURING CO.

2885 Spring Grove Avenue, Cincinnati 25, Ohio



Specialists in the Design, Manufacture and Installation of Dust Control Systems and Industrial Ovens; Plating and Pickling Tanks, Baskets and Acid-Fume Removal Systems; COPPER, MONEL, STAINLESS STEEL, and other METAL ALLOY FABRICATION

Contract Manufacturers in All Sheet Metals and Light Structurals



KIRK AND BLUM

A Kirk & Blum Conveying System recently installed for Wm. S. Merrell Co., Cincinnati, for transporting drugs a distance of 500 ft.

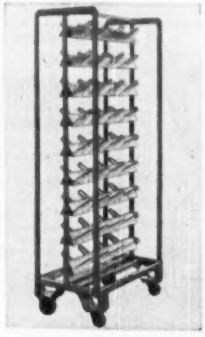
Above illustration shows application of a cyclone and dust filter combination for bag cleaning. Cyclone serves as primary collector for coarse or fibrous particles so that only fine dust is carried to dust filter.

A Kirk & Blum unit of large quantity powder storage hoppers, made of 12 gauge steel, reinforcing angle round top, ¾ in. thick ply metal cover, swivel casters and rotary feed valve; for use in the manufacturing of face powder.

PRODUCTS

Dust Control and Shavings Removal Systems; Industrial Ovens for drying, baking, enameling and lacquering.

Fume and Heat Removal Systems; Ventilating and Air Conditioning Systems; Cooling, Drying and Heat Reclamation Systems.



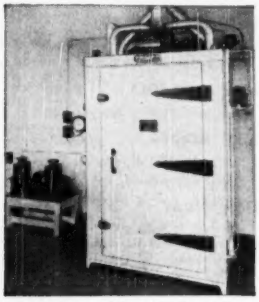
Pickling Baskets, Crates, Lead and Rubber-Lined Tanks; Acid-Fume Exhaust Systems.

Other Products: One-piece Elbows; Blast Gates; Pressed and Rolled Steel Flanges; Belt and Machine Guards; Tote Boxes; Steel Tables; Pressed Steel Louvre Panels, Special Racks and Trucks.

ENGINEERING SERVICE

Kirk & Blum Engineering Service—backed by over 43 years of experience in designing and installing Kirk & Blum equipment for many industrial leaders of United States, Canada, South America—is at the disposal of plant engineers or other factory officials. This service—assuring a definite solution to any problem requiring Kirk & Blum Equipment—includes:

A thorough analysis of the requirements of the job, designing the equipment; submitting a proposal, together with complete specifications and a written performance guarantee; installation by experienced, efficient erectors. Complete information and valuable data on request.



Kirk & Blum Sheet Metal Fabrication. This is one of a series of bobbin racks for rayon plant. Another example of the diversity of products made by Kirk & Blum for various industries.

A Kirk & Blum steam-heated, drying oven, for drying granular chemicals. Built of galvanized steel to resist intense moisture. Automatically controlled by means of air operated controls. All inside parts are steel cadmium plate. Maximum temperature 160 degrees. Can be built for higher temperatures.

Kirk & Blum Small Laboratory Ovens for research and test work for various scientific purposes. Equipped for electricity or gas (direct and indirect) for heating. Model shown is indirect gas heated; mechanical ventilation.

Kirk & Blum Steel cubicles for housing of electrical and air outlets, switches, circuit breakers, etc. An example of the varied sheet metal products fabricated for the electrical industry.

PIPE THAT CARRIES ACID SAFELY

Durco bell- and-spigot and split flanged pipe and fittings provide safe passage for a wide range of acids and other corrosives. Made in Duriron and Durichlor (high silicon irons), they are inherently corrosion-resistant, requiring no protective coating. Bulletin 70 describes bell-and-spigot type, bulletin 704 describes split flanged pipe.

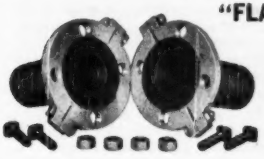
GOODALL *Means Safety and Economy in Plant and Laboratory . . . .*

Goodall **quality** in products for the Chemical Industry has established a reputation for long, reliable service that warrants your confidence. The items described below have long proven their practicability and economy.

"KEMITE" DUCT has extreme flexibility; a pure natural rubber tube that's highly resistant to abrasive wear and permeation of liquids or gases; a patented wire-reinforced carcass that will not collapse or kink, even on sharp bends; and a tough, long-wearing cover that is not affected by acids or fumes. Sizes, ¼" to 4".



"GOODITE" PIPE has the same characteristics as "Kemite", but is made in larger sizes—up to 12". Available in two constructions, for either suction or discharge.
Both "Kemite" and "Goodite" can be furnished with tube compounded to meet specific service requirements; and complete with "Flang-Lok" ends and "Flang-Lok" Flanges.

GOODALL EXPANSION JOINTS

New principles of construction and operation make Goodall Rubber Expansion Joints superior to other types in strength, efficiency, safety, and ease of installation. Available for all standard pipe sizes from ⅜" to 96", I.D., on lines carrying fluids, steam, air or gases, under vacuum or pressure, at temperatures up to 250° F. Designed for use with "Flang-Lok" Flanges.

"FLANG-LOK" FLANGES

are quickly installed. Each flange is in two sections. Standard drilling permits easy bolting to pipe flanges. Shaped to fit "Flang-Lok" ends of "Kemite Duct", "Goodite Pipe" or Goodall Expansion Joints, they draw them together to form a rubber-to-rubber seal that remains permanently leakproof. No metal comes in contact with material passing through pipe or joint.

"SNAP-IN" LOOSE RUBBER LINERS . . .

The practical way to make your metal containers last much longer. To save time and shipping costs, send just one tank, barrel, drum, etc., to our factory at Trenton, N. J. From this master pattern, we will make any number of rubber or synthetic liners for containers of identical size and shape. Snap-over edge at top holds liner in place, but it can easily be loosened to release accumulated gases, or removed for repairs to liner or container.

"ALLGOOD" APPLIED COATINGS

Rubber or synthetic compounds applied to the inner or outer surfaces of all types of equipment, to provide long-lasting protection against corrosion, abrasion or contamination from virtually any source. Coatings can be applied to parts or products of any size or shape—in your own plant or upon shipment of units to Chicago or Trenton.

OTHER GOODALL PRODUCTS FOR CHEMICAL PLANTS include Acid, Water, Steam, Air and Fire Hose; Conveyor and Transmission Belting; Rubber and Synthetic Gloves, Clothing and Footwear.

PILOT PLANTS

Artisan engineers, experienced in problems of heat transfer, distillation, and evaporation, have worked successfully with many recognized leading firms in the Chemical Process Industries.

Artisan workmen—artisans all—are experienced in handling all metals. Welding processes are qualified under the A.S.M.E. Code, by Hartford Steam Boiler, and equipment may be registered with the National Board of Boiler and Pressure Vessel Inspectors

JABSCO
Corrosion Resistant
PUMPS

Patented and Pats. Pend.

SELF PRIMING. Obtains vacuum in excess of 26".

VERSATILE. Handles variety of liquids and slurries at wide range of speeds.

SAFE. Self-priming feature permits cleaner, safer, more accessible installations.

SIMPLE. Easily and quickly disassembled for cleaning.

TROUBLE FREE. Impeller lubricated by liquid pumped. No oil or grease cups. No packing. No metal to metal contact of moving parts.

MORE CAPACITY for its size and price than any other type of pump. Capacities up to 56 GPM. Pressures up to 35 PSI.

FLEXIBLE IMPELLER. Odorless, tasteless, non-toxic corrosion resistant neoprene—also gum rubber if specified.

Stainless Steel Models available in ⅜", 1" and 1½" port sizes.
Bronze Models available in ½" up to 1½" port sizes.
Cast Iron Models available in 1", 1¼" port sizes.

For PULVERIZING and DUST COLLECTION Applications

THE MIKRO-PULVERIZER
a dustless Pulverizer for dry or wet milling, granulating, blending — no fans, cyclones or separators.

THE MIKRO-ATOMIZER
a new mechanical screenless Pulverizer for the efficient production of ultra-fine powders from 1 to 25 microns.

THE MIKRO-COLLECTOR
a radically different system of dust collection employing revolutionary principles that insure optimum dust recovery and sensational filter rates.

Denver *Adjustable Stroke* Diaphragm Pumps

for corrosive and caustic pulps

these Denver Adjustable Stroke Diaphragm Pumps will handle 35 percent solids and 65 percent solution by weight of a caustic with salt in suspension; liquid specific gravity 1.29, specific gravity of solids 2.5, temperature 120° F. This is a typical application for these units. Corrosive pulps are easily handled with these pumps due to their adjustable stroke feature while in operation, which insures positive control with uniform discharge density. Write for Bulletin No. P8-B.

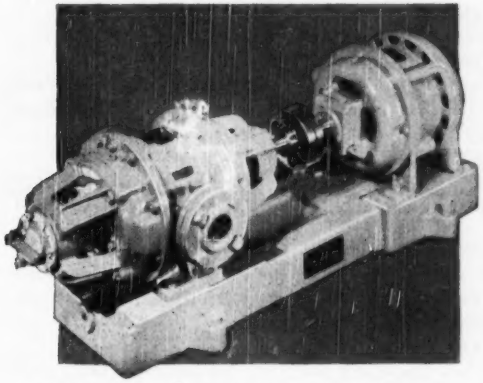
HIGH VACUUM PUMPS

Rotary — Positive
Vacuum to 10 Microns
Capacities, 1 to 850 c.f.m.
For dry or wet vacuum



Exclusive design embodies automatic air-oil and water-oil separator and lubrication system. Oil-sealed action, slow pump speed yet high-speed evacuation, trouble-free service. Also air compressors and gas boosters.

NASH VACUUM PUMPS

Nash Vacuum Pumps have but one moving part, rotating without metallic contact, and requiring no internal lubrication. There are no valves, gears, pistons, rings or similar mechanical complications.

Vacuum is non-pulsating, and these pumps will handle a liquid and a vapor simultaneously. Slugs of liquid entering pump do no harm.

Nash Vacuum Pumps maintain vacuums up to 27" in single stage design, higher vacuums in two stages. Built for consistent performance and long life. Request bulletins.

DENVER-DILLON VIBRATING SCREENS

This screen embodies a basically different principle in the application of circle throw motion, the entire weight of the load and the screen is carried on 4-Spring-cushioned Rubber Insulated Suspension Rods and thus no weight is carried by the bearings. Maintenance and power costs are low.

- Scrubbers
- Dust Separators
- Gas Separators
- Dehydrators
- Steam Drums
- Knock-out Drums
- Evaporators
- Air Intercoolers, Aftercoolers

York separators perform equal or superior to any other separator. Elements fabricated to fit exactly into existing equipment in your plant. Improves quality of overhead product; eliminates product loss by entrainment; increases production by operating at greater vapor velocities. For laboratory, pilot plant and full scale equipment in any material of construction.

Chemical Industries

Sound, down-to-earth information for chemical men!

No abstruse, long-winded, theoretical treatises to wade through in Chemical Industries—but pithy, practical, dollars-and-cents material to help technical and business men in the chemical process industries do a better job—Yes, there's gold in CI's columns for YOU and every other chemist, chemical engineer, plant manager, research director and busy executive!

Regular monthly departments and special features

Newsletter—news before it's news, tells who's going to do what and why.
What's New—brief, interpretive discussions of new developments—highlights background, potentialities, immediate and future effect on business.
Special Features—specific phases of the various branches of the chemical process industries authoritatively presented by top men in each field—subjects chosen for timeliness and importance.
New Products and Processes—descriptive sketches—characteristics, uses, source—Technical Data Service in conjunction with this department—handy key system to obtain all available information on particular product or process.
New Equipment—has its own special department—dittos in style New Products and Processes Department.
Patents and Trademarks—digest of current chemical patents classified by industry—a real time-saver.
News of the Month—Chemical News in Pictures, General News, Canadian News, *Chemical Specialties News*, Chemical Markets, Chemical Economics & Statistics, Current Prices.
Packaging and Shipping—new designs, methods, materials—government regulations.
Booklets & Catalogs—lists available free chemical and equipment booklets—convenient coupon system to send for them.
Laboratory Notebook **Industry's Bookshelf**

Special Annual Issues

New Chemicals—New Equipment Issue—a catalog of new chemicals, chemical specialties and equipment items introduced during the year, bound into special issue once a year.
Annual Buyers' Guide—800-page directory of complete buying information, listing over 30,000 chemical and equipment items with their sources of supply, trade names, physical properties, formulas, etc. Bound separately for convenient, all-year-round, daily use, but included with year-end issue of Chemical Industries.

No other magazine presents so complete a picture of the chemical process industries.
No other chemical magazine carries so much information so early.
No other magazine demands so little reading time for such extensive news coverage.

CI is the chemical magazine of industrial news significance—
CI not only presents the news in short, clear synopsis—but
CI interprets chemical developments and trends for their present and future significance.

If you want helpful, valuable, profitable information about the chemical process industries, mail this coupon to

TUBE CLEANERS

Airetool Mfg Co, 362 S Center St, Springfield, O — 3-4989

TUBE CLEANERS and EXPANDERS

A complete line, precision-built for every type and size of tube used in chemical processing. Powerful air or steam driven cleaners with brush, expanding blades or new form cutter heads efficiently remove all types of scale. AIRETOOL Tube Expanders are self-feeding and parallel rolling. They are expertly designed to produce unridged surfaces and uniformly tight joints.

THE AIRETOOL-FISHER TUBE EXPANSION CONTROL

For Heat Exchanger and Condenser Tubes

A proved system of calibrated control mechanism, electric motor and ball-bearing tube expanders that automatically regulates expansion to the right degree for tube size and metal type.

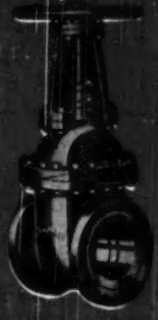
CHAPMAN VALVES

for All New Chemical Processes

(A) Non-Rising Stem-Outside Screw and Yoke Valve, 4-way pattern, flanged ends and flanged bonnet, 10" size. Body...

(B) 150-lb. Solid Wedge Steel Gate Valve, A.S.A. and A.P.I. Ratings.

(C) Alloy and Stainless Steel Globe Valve (4" to 2") with super-hardened seat and wedge.



In the development of all today's widely used chemical processes . . . including production of synthetic rubbers . . . Chapman has been one of the chief reliances of the industry in meeting new requirements for valves. Shown here are a few Chapman Valves, developed for special requirements, which are now included in Chapman's standard line.

Through many years of experience, chemical researchists have learned that Chapman's laboratory technicians, designers, and field engineers can always be counted on for 100% co-operation . . . that Chapman has invaluable facilities for producing special alloy steels . . . and that Chapman's solid grounding of practical experience in pioneering new processes is a powerful aid to progress.

Are you taking full advantage of Chapman co-operation and "know-how"? If not, let's talk it over, and see how we can help.

(D) 150-lb. Solid Wedge Steel Gate Valve A.S.A. and A.P.I. Ratings.

(E) Cast Iron Body Double-Disc Gate Valve, rated 200 lb. pressure.

EVACTOR

STEAM JET VACUUM PUMPS

Croll-Reynolds Steam Jet Evactors are made in single, two, three, four, and five stage units for any vacuum up to a few microns absolute. More than 10,000 installations are serving all types of condensers and chemical processing units. There are no moving parts which means extreme simplicity and dependability. Constant research and development by an organization which has specialized on this equipment for over thirty years has also provided exceptional efficiency.

CHILLED WATER FOR PROCESS COOLING

Croll-Reynolds Chill-Vactor equipment uses the Evactors described above to chill water and aqueous solutions by evaporative cooling. The total capacity of Chill-Vactors installed to date is equal to over 25,000 tons of ice per day. This equipment is furnishing chilled water for air conditioning, chilled liquors for chemical process work and for chilling porous solids and wetted surfaces.

it's too late

for this edition.
But, if you sell to the chemical process industries, you can be represented in our upcoming revision.

We can list your company under the products you sell.

It will help us make the Buyers Guide even more complete. And it will help the thousands of buyers who use the Guide in the U. S. and 58 foreign countries to route their inquiries, place their orders.

What to do? Just drop us a line and tell us about your main products.

Chemical Industries Buyers Guide

How to cover the Chemical Industries...

COMPLETELY—EFFECTIVELY—ECONOMICALLY

IT'S A BIG MARKET

The chemical process industries are basic, still-growing and *stable*. They buy:

Raw Materials	$7,242,000,000
Maintenance Materials	281,000,000
Fuel and Power	498,000,000
Containers	305,000,000
Transportation	350,000,000
Supplies and Services	159,000,000

COVERAGE THAT COUNTS

In the process industries, 1,843 plants produce more than $1 million worth of materials annually; 2,978 plants fall into the $500,000 category.

CI will take your sales message into 3,552 plants estimated to represent 76 per cent of the industries' total purchasing power.

Here's a breakdown of calculated coverage industry-by-industry:

Textile Processing	61%
Pulp and Paper	34
Paints, Varnish, Colors	74
Animal and Vegetable Oils	37
Drugs, Medicines, Toilet Preparations, Insecticides	81
Soap and Glycerine	96
Rayon and Allied Products	97
Hardwood Distillation, Naval Stores	45
Fertilizers	31
Industrial Chemicals	96
Miscellaneous Chemical Products	97
Petroleum Refining	81
Rubber Processing	98
Leather Tanning	23
Cement, Lime, Refractories	26
Non-Ferrous Metallurgy	93

CONCENTRATED BUYING AUDIENCE

CI's highly selective (ABC) circulation is aimed not at the mass but at the market. A certified survey has established that each copy of CI has an average of 2.77 readers (active audience: 29,400) and that 73.2% of these readers buy, specify or recommend the purchase of chemicals, equipment, containers, raw materials.

EDITORIAL SCOPE

CI is edited for the active, responsible leaders of the chemical industries. It is designed, specifically, to provide these men—the industries' planners and doers—with the essential information they must have in concise, readable, understandable form.

Editorially, CI is not concerned with the abstruse and the highly theoretical; it does stress what new technical developments mean *economically*, their overall significance and import, how they will affect markets, processing techniques, packaging procedures, etc. CI is practical, useful, usable.

How well do CI's industrially-experienced editors do their job of weighing, appraising, interpreting, integrating, featuring? Here's one criterion: This year CI won Industrial Marketing's highest award for outstanding editorial achievement.

CI commands the reader interest of the important people you want to reach.

It forms a potent, productive vehicle for your sales message.

LOW COST CONTINUITY

Want to sharpen your pencil and figure how you can talk to this husky, stable industry *often enough* and *regularly enough* to get your share of the $8.8 billion it spends annually? Here's how:

You can get in touch and keep in touch with CI's purchase-potent readers on a very modest budget. Twelve full pages in black and white—keeping the industry reminded *every month of the year* of you and your products costs only $2,100. Economical, effective continuity. Real coverage.

It *costs less* to be represented in CI every issue than in any other monthly or weekly publication in the field.

Let's talk about your problem, your opportunity, what we can do for you. Write, phone or wire.

FREE:

Is your company listed as a source of supply in this edition of CI's BUYERS GUIDE—the industry's most complete and widely used reference and buying directory? Whether you advertise or not you are entitled to ten FREE listings under the product classifications you select.

Drop us a line and we'll make sure you are represented in our next edition. No obligation, of course.

A McGRAW-HILL PUBLICATION

Index and Trade Name Dictionary

Index direct page reference to all Chemical & Raw Materials, Specialties, Equipment and Container Products with commercial and scientific synonyms, brands, and trade names

The arrangement is strictly alphabetical, with the nouns or class names first. Examples: Acetic Acid look for Acid, Acetic; for Textile Detergents look under Detergents, Textile.

The chemical salts are listed under the metallic element. Examples: under Barium, from Barium Acetate to Barium Zirconium Silicate, are 30 different barium salts: Sodium Chloride is found under Sodium in alphabetical order with the other sodium salts, not under Chloride.

Capital letters in the Index indicate a definite heading in the Buying Guide (white pages) and refer directly to the exact page number on which this item appears.

Suppose, as a test, you want to buy "Alapurin": you will find this word in the index listed as follows:

Alapurin, see Lanolin

and you know that this is a synonym for Lanolin which you can find in the Index and learn at once the exact page upon which it is to be found.

Take as another example, Alkolene, which you look up and find:

Alkolene: Martin Dennis Co., Newark, N. J., fat liquor.

and you know that this is the trade name of a fat liquor, made by Martin Dennis Co.

Dibutoxy Ethyl Adipate. An excellent plasticiser with high efficiency for polyvinyl resins, nitrocellulose, ethyl cellulose, etc. Recommended for use where extremely low temperature flexibility, permanence, low water extraction, and resistance to ultra-violet light are required. Boiling range @ 4 mm. 200°C. to 220°C. Freezing point —39°C.

ADIPOL 2 EH: Ohio-Apex, Inc., Nitro, W. Va. Nitro 152

Di-2-Ethylhexyl Adipate. An excellent plasticiser for polyvinyl resins, nitrocellulose, ethylcellulose and other resins. Recommended for use where excellent electrical properties, extreme low temperature flexibility, permanent flexibility, low water loss, resistance to U-V light, heat stability, and easy processing are required. Boiling range @ 4 mm., 205-220°C. Freezing point, —70°C. (stiff, clear gel.)

Diethoxy Ethyl Phthalate. Ethoxy Glycol Phthalate. An excellent plasticizer for nitrocellulose and polyvinyl resins. Has good resistance to light and its low oil solubility improves the oil resistance of films. Since Ethox freezes at 31°C., it is usually a solid and its use requires a warming oven or bath. Most resins are soluble in Ethox.

KP-23: Ohio-Apex, Inc., Nitro, W. Va. — Nitro 152

Butoxy Ethyl Stearate. This ester is often used in addition to other plasticizers to impart some special property. It is similar in many respects to butyl stearate but has a higher boiling point, higher solvent power and lower freezing point. KP-23 freezes at 18°C. to 17°C. Boiling range @ 4mm., 215°C. to 250°C.

KP-140: Ohio-Apex, Inc., Nitro, W. Va. — Nitro 152

Tributoxy Ethyl Phosphate. One of the more valuable alkyl phosphates. Makes elastic and permanent plastics. Imparts extreme low temperature flexibility, and it is flame retardant. Has found special favor as a plasticizer for Neoprene and Hycar. Excellent as a softener. Freezing point—70°C. (very viscous liquid). Boiling range 200°C. to 232°C. @ 4 mm.

KP-150: Ohio-Apex, Inc., Nitro, W. Va. — Nitro 152

Fatty, phthalic acid esters. An excellent plasticizer for nitrocellulose, polyvinyl resins, etc. Recommended for good hand, low temperature flexibility, low water extraction and resistance to ultra-violet light. Boiling range @ 4 mm. 170°C. to 215°C. Freezing point—30°C.

Dibutoxy Ethyl Phthalate. Butoxy Glycol Phthalate. Solvent plasticizers for most resins and very permanent. Recommended for Vinylite and nitrocellulose because of its resistance to light and hydrolysis. Also recommended for cellulose acetobutyrate, cellulose nitrate and ethyl and benzyl cellulose. Boiling range @ 4mm. 210°C. to 233°C. Freezing point—50°C. (very viscous liquid).

KRONITEX: Ohio-Apex, Inc., Nitro, W. Va. Nitro 152

Tricresyl Phosphate. A nearly colorless, neutral, odorless, oily ester. Widely used plasticizer because of its stability and compatibility with many resins. Recommended for Neoprene, Hycar, Ethyl Cellulose and as an additive for extreme pressure lubrication. Has excellent fire retarding properties. Boiling range @ 4mm., 240°C. to 260°C. Freezing point—35°C. (very stiff clear gel).

Reader Service

An Expanded Service To You

To receive more information about any product advertised in the Buyers Guide, write your request on one of these easy-to-use cards. The result is . . . time saved for you, with no letters to write, and no postage required.

HOW TO USE

Fill in the product on which you want more information, the advertiser's name, the number of the page on which the ad appears — plus your name, position, and address. Mail the card to us. We tell the company of your interest and he replies direct to you.

This handy Buyers Guide is divided into distinct sections, each of which will be a valuable source of information to you—not only now, but in the future too. Keep it handy—you will have continuing use for it—and for the Reader Service cards.

INDEX OF ADVERTISERS

. . . . . PAGE 4

Here is a vital department for you—lists all the advertisers in the Guide—if you see a company's name there and read his ad and would like to know more about his product or service, just tear out one of the cards at the right, fill it in, and mail it.

CATALOG SECTION

. . . . . PAGE 8A

In this section are full page advertisements with descriptive treatment of chemicals and equipment that you may want to know more about—use a Reader Service Postcard.

CHEMICAL COMPANY DIRECTORY

. . . . . PAGE 9

Want to know what company makes a certain kind of chemical in a particular area? This part of the Buyers Guide gives you the answer. Notice the advertisements scattered through the pages—do you see something you would like to know more about? Send a postcard to us.

CHEMICALS & RAW MATERIALS

. . . . . PAGE 49

In alphabetical order, here are the chemicals and raw materials—with the names of the companies who supply them. Use a card at the left to inquire about any products you see advertised in the ads liberally sprinkled up and down the pages. We will tell the company that you saw his ad and want additional information.

RESEARCH CHEMICALS

. . . . . PAGE 469

This new section consists of an alphabetical list of industrial research chemicals, both organic and inorganic, together with their manufacturers. Listings are limited to chemicals that are currently being produced in research quantities only.

CHEMICAL SPECIALTIES

. . . . . PAGE 481

In this section are listed all the chemical specialties in alphabetical order, and all the companies supplying the specialties. Use the Reader Service postcards at the left to get more details on any product that you see advertised in this section.

EQUIPMENT AND CONTAINERS

. . . . . PAGE 619

Do you need some more information on the multitude of equipment and containers advertised here? The ads can be found in the pages of this section which list alphabetically the suppliers of this kind of equipment Just fill in the cards and we do the rest.

IN GENERAL . . .

You can use our Reader Service free postcards for any advertisement appearing in the Buyers Guide. This, of course, includes front, inside and back cover-ads as well as the ads in the individual sections. Let us do the work for you—fill out one of the cards and mail them in. We'll tell the companies your interests. They'll answer you direct.
